EXECUTIVE SUMMARY

Environmental Resources Management Australia Pty Ltd (ERM) was engaged by Acciona Construction Pty Ltd & Ferrovial Construction Pty Ltd Joint Venture (AFJV) to conduct a Detailed Site Investigation (DSI) at the Sydney Olympic Park (SOP) Construction Site. The SOP Construction Site is located at the corner of Olympic Boulevard and Figtree Drive, Sydney Olympic Park, NSW 2127 (the Site). The Site comprises land that will form the Sydney Olympic Park Metro Station, as well as land used for 'Construction Support'. The construction on Site includes creation of a 'Station Box' by excavation from surface as a cut and cover structure, and tunnel sections entering and leaving the Station Box by tunnel boring machines. The Station Box Area is approximately 7,045 m^2 and the remaining Construction Support area is approximately 31,517 m^2.

This DSI was undertaken to enable collection of sufficient environmental data to supplement previous investigations and refine the understanding of potential contamination associated with current and historical land use, to determine whether remediation is required and to provide data to facilitate waste classification of material to be removed within the Station Box. The in-situ waste classification is to be prepared separately by others.

The works were completed in general accordance with *Sampling Analysis and Quality Plan* (ERM SAQP, 2022), reviewed and accepted by the Site Auditor, James Davies.

The desktop investigation undertaken comprised review of historical aerial photographs council and regulatory records available, and available previous investigation. The following is noted:

- Based on a review of the historical aerial photographs, the Site was observed to be mainly open space and rail infrastructure until circa 1986, when the railway was discontinued and the infrastructure demolished. The Site was cleared and it appears major earthworks have been undertaken on Site. The buildings currently present on Site, appeared to have been constructed circa 1991 and remain unchanged since. The surrounding areas predominantly comprised agricultural land and road/rail infrastructure with one large industrial compound to the north of the Site. The industrial compound and associated areas to the north were developed until circa 1970 and remained unchanged until circa 1994 when it was demolished. The surrounding areas were progressively developed into the commercial/industrial area currently present during the 1990s for the Sydney Olympic Games of 2000, and has not undergone significant changes since.
- One delicensed activity still regulated by the NSW EPA was identified on Site, Silanna Semiconductor Pty Ltd. The activity is listed as 'hazardous, industrial or Group A Waste Generation or Storage'. Three sites listed as NSW contaminated sites notified to the EPA were identified within 500 m of the Site, Bicentennial Park landfill located south east of the Site, 'Golf Driving Range' located south of the Site, and Aquatic Centre car park located south west of the Site. Based on the close proximity to the Site and the proposed dewatering anticipated to change the groundwater flow direction potentially making these sites hydraulically up gradient, it is considered a potential risk exists pertaining to leachate-contaminated groundwater being drawn towards the Station Box as a result of dewatering. Therefore, the land uses considered the most significant for the proposed Sydney Metro construction works are the three landfills located surrounding the Site.
- Golder-Douglas Partners (GDP) installed several on and off-site groundwater monitoring wells which were sampled between 2018 and 2022. The groundwater data contained concentrations of some constituents above ecological screening criteria but no human health screening criteria was exceeded with the exception of the nickel at SWM_ENV_712s located just to the north of the station box.

ERM completed intrusive investigations between 12 January 2022 and 09 February 2022 and comprised the progression of 45 boreholes in total, conversion of five boreholes to hazardous ground gas (HGG) monitoring wells, three rounds of hazardous ground gas (HGG) monitoring and the sampling of three offsite and two on-site groundwater wells. The following results are noted:

- Soil samples reported concentrations of contaminants of concern (CoPC) below the laboratory limit of reporting (LOR) and/or below adopted health and ecological screening criteria. It should be noted that per- and poly-fluoroalkyl substances (PFAS) was detected within three shallow soil samples analysed. Furthermore, detectable concentrations of semi- and volatile compounds were identified within several soil samples analysed at depth from shale inside the Station Box area.
- Three offsite groundwater wells were sampled and reported concentrations of metals and ammonia above adopted ecological screening criteria. Five groundwater wells (two located on-site and three off-site wells) were sampled and reported concentrations of ammonia, total phosphorous and nitrogen, arsenic, copper, iron, nickel, zinc and PFOS exceeded adopted ecological criteria. Detectable concentrations of some other PFAS compounds were also reported at two of monitoring wells (SWM_MW19, located off-site to the west, and Sub-W1, located on-site). Human health screening criteria were not exceeded, however the sodium, chloride and iron concentrations exceeded aesthetic guideline values.
- Three rounds of HGG monitoring was undertaken and identified elevated concentrations of carbon dioxide with a maximum reading of 12.8% v/v and a maximum flow rate of 0.1 L/hr. The subsequent calculation of gas screening value (GSV) and associated characteristic situation (CS) were calculated to be *"very low risk"* and CS 1.

Based on the combined dataset, the conceptual site model (CSM) was refined and source-pathway-receptor (SPR) linkages were assessed. The potentially viable SPR linkages are as follows:

- Potential risk to Sydney Metro current and future construction workers and users via direct contact with groundwater.
- Potential risk to recreational users of Parramatta River via direct contact/ingestion of groundwater to surface water in the Parramatta River. Potential risks to aquatic organisms in Parramatta River from discharge of impacted groundwater.
- Potential risks associated with hazardous ground gas in groundwater to future construction workers and users of the Site.

Overall based on the findings of the previous assessments, desktop investigation, the findings of this DSI and the refined CSM, and subject to the limitations of this report, the following is concluded:

- Soil sampling has been undertaken in accordance with the minimum sampling densities specified within NSW EPA (1995). Soil sample results have been compared to the relevant health-based and ecological criteria for in-situ soils. As such, it is considered sufficient characterisation of the soil has been undertaken and a risk posed to receptors from soil is not identified. It should be noted that boreholes are recognised as not being the most effective way to detect asbestos in soils. Therefore, an unexpected finds protocol is recommended to mitigate risks associated with potential unexpected finds. Additionally, required sampling density for in-situ waste classification in accordance with the Victoria EPA waste guidelines (IWRG702) is considered met.
- On-site and off-site groundwater data indicate COPCs are generally below human health screening criteria with the exception of nickel in groundwater just beyond the northern site boundary. Direct contact with groundwater should therefore be avoided.
- On-site and off-site groundwater data also indicate COPCs exceed ecological criteria, and so treatment of the water is necessary prior to discharge to a surface water body, as planned, and to be regulated under an EPL.

- Methane in groundwater is not present at concentrations that could produce hazardous conditions at the site. While dissolved methane is in groundwater off-site, and dewatering will result in groundwater from off-site migrating to the station box, it is considered unlikely that groundwater containing dissolved methane concentrations that could produce hazardous conditions will occur at the station box. Monitoring and management of groundwater and ground gas will be required to ensure risks to site users from dissolved gases in groundwater remains absent. Monitoring and management requirements are proposed to be included in the Groundwater Management Plan.
- Hazardous Ground Gas (HGG) monitoring identified elevated concentrations of carbon dioxide, however, the calculated GSV was calculated to be *"very low risk"* and a Situation 1.

Based on the information outlined within this DSI, ERM considers that the Site is suitable for the Sydney Metro station use, subject to the following:

- An Unexpected Finds Protocol (UFP) should be prepared as part of the Construction Environmental Management Plan (CEMP) to be implemented during the construction works, to outline the safe and appropriate actions to be undertaken in the event of encountering potential contamination that may arise from unexpected sources, including asbestos in soils during the construction works.
- Requirements for the monitoring and management of groundwater and ground gas in the vicinity of the Sydney Olympic Park site is to be documented in an updated version of the Groundwater Management Plan (GWMP) and implemented accordingly.
- Appropriate measures are specified within the Soil and Groundwater Management Plan, and any relevant occupational health and safety procedures to prevent direct contact with groundwater during construction and operation of the Station.

As remediation is not required a Remediation Action Plan (RAP) is not considered necessary for the purposes of rendering the site suitable for use, however ERM understands that a RAP is to be prepared for the purposes of detailing the spoil removal plan.

ERM considers that the applicable requirements of the Deed and the project CoA have been complied with.

1. INTRODUCTION

1.1 General

Environmental Resources Management Australia Pty Ltd (ERM) was engaged by Acciona Construction Pty Ltd & Ferrovial Construction Pty Ltd Joint Venture (AFJV) to conduct a Detailed Site Investigation (DSI) at the Sydney Olympic Park (SOP) Construction Site. The SOP Construction Site is located at the corner of Olympic Boulevard and Figtree Drive, Sydney Olympic Park, NSW 2127 (the Site).

This DSI was undertaken to enable collection of sufficient environmental data to supplement previous investigations and refine the understanding of potential contamination associated with current and historical land use, to determine whether remediation is required and to provide data to facilitate waste classification of material to be removed within the Station Box. The in-situ waste classification was prepared separately by others (and is included as Appendix H of this report). The Site location and current Site layout is presented on **Figure 1.**

1.2 Background

The Sydney Metro West line will extend from Hunter Street Station to Westmead and is being procured in three packages. This DSI relates to works at the Sydney Olympic Park Station Construction Site which is part of the Central Tunnelling Package (CTP), from The Bays to Sydney Olympic Park, for which AFJV has been awarded the contract for tunnelling and construction works.

The Sydney Olympic Park Construction Site is located on Olympic Boulevard, opposite the Aquatic Centre. The Site comprises land that will form the Sydney Olympic Park Metro Station, as well as land used for 'Construction Support'. The construction on Site includes creation of a 'Station Box' by excavation from surface as a cut and cover structure, and tunnel sections entering and leaving the Station Box by tunnel boring machines. At the time of writing, there is no potential excavation proposed outside the Station Box with the exception of limited excavation and off-site removal of spoil for installation of service infrastructure across the remainder of the Site. The future use of the Construction Support area is proposed to be commercial / retail development areas, high density residential buildings with retail and community space and station access to primarily comprise open space with surface hardstanding (Sydney Metro, 2022).

The proposed extent of the Station Box and the Construction Support areas are presented within **Figure 2**.

Several previous investigations, including an Environmental Impact Statement (EIS) have been undertaken for the Site (Jacobs EIS, 2020[1]). Based on the information available, ERM prepared a Sampling and Analysis Quality Plan (ERM SAQP, 2022[2]) for the DSI works. The objective of the SAQP was to describe the data quality objectives (DQOs) and required investigation methodology for undertaking the investigation works including sampling, analytical and reporting requirements to assess the potential risk to human health and the environment associated with the potential presence of contamination at the Site. This SAQP was reviewed and accepted by the Site Auditor, James Davis of Enviroview Pty Ltd. This DSI was undertaken in general accordance with the procedures set out within the SAQP (ERM, 2022).

1.3 Objectives

This DSI was undertaken to enable collection of sufficient environmental data to supplement previous investigations and refine the understanding of potential contamination associated with current and historical land use, and to evaluate whether remediation is required.

[1] Jacobs Engineering Group, *Sydney Metro West Environmental Impact Statement – Westmead to the The Bays and Sydney CBD,* ref: IA19980, dated 15 April 2020 (Jacobs EIS, 2020).

[2] ERM, *Sampling Analysis and Quality Plan, Sydney Olympic Park Station Construction Site, Sydney Metro West: Central Tunnelling Package,* Project no: 0628507, dated 24 January 2022 (ERM SAWQP, 2022).

The specific objectives of the DSI were to:

- Obtain sufficient environmental data to enable the proposed construction works to be conducted, to accurately characterise the Site and to assess the suitability of the Site for the proposed commercial / industrial land use in accordance with applicable NSW and Australian guidance;
- Obtain sufficient information to enable proposed excavation to be conducted in accordance with the sampling densities outlined within Table 3 of the *Victorian EPA Industrial Waste Resource Guidelines: Soil Sampling* (2009) referenced within the NEPM;
- Comply with the Conditions of Approval for Sydney Metro West – Concept and Stage 1 Construction (SSI 10038) ("the CoA"), specifically Condition D71 which reads:

  "Before commencement of any construction that would result in the disturbance of moderate to high risk contaminated sites as identified in the documents identified in ***Condition A1*** *of this schedule,* ***Detailed Site Investigations*** *(for contamination) must be conducted to determine the full nature and extent of the contamination. The* ***Detailed Site Investigation Report(s)*** *and the subsequent report(s), must be prepared, or reviewed and approved, by consultants certified under either the Environment Institute of Australia and New Zealand's Certified Environmental Practitioner (Site Contamination) scheme (CEnvP(SC)) or the Soil Science Australia Certified Professional Soil Scientist Contaminated Site Assessment and Management (CPSS CSAM) scheme. The* ***Detailed Site Investigations*** *must be undertaken in accordance with guidelines made or approved under Section 105 of Contaminated Land Management Act 1997 (NSW). The* ***Detailed Site Investigation*** *for Sydney Olympic Park metro construction site must be prepared in consultation with SOPA";* and
- Comply with the requirements of the Sydney Metro West Central Tunnelling Works Design and Construction Deed (the Deed) contract no. 00013/13033 between Sydney Metro and AFJV. The relevant requirements of the Deed are provided in **Section 1.4** below.

It should be noted that an in-situ waste classification report and/or preliminary waste classification will not be provided by ERM, as this is being prepared by others.

1.4 Requirements of the Deed

With respect to the provision of the DSIs, the Deed requires (clause 12.19):

(a) *Except for Preliminary Works, the Tunnelling Contractor must perform and submit to the Principal's Representative and the Independent Certifier a Detailed Site Investigation prior to commencing any excavation activities:*

  (i) *at any Area of Contamination Concern; and*

  (ii) *to the extent otherwise required under the Planning Approvals.*

(b) *Notwithstanding clause 12.19(a), the Tunnelling Contractor may also perform additional Detailed Site Investigations carried out in other areas of the Construction Site or outside the Construction Site if the Tunnelling Contractor deems it necessary to manage the risks associated with contaminated land and to appropriately plan for Remediation. Any additional Detailed Site Investigation performed in accordance with this clause 12.19(b) must also be submitted to the Principal's Representative and the Independent Certifier.*

(c) *Each Detailed Site Investigation:*

  (i) *must*

    (A) *investigate areas of proposed excavation or disturbance;*

    (B) *investigate land within the Construction Site or Extra Land surrounding the areas of proposed excavation or disturbance with*

respect to the potential migration of Contamination via groundwater, ground gas, vapour and odour into the areas of excavation or disturbance; and

(C) *characterise risks to the construction, operation and maintenance of Sydney Metro West and its infrastructure from Contamination,*

(ii) *be prepared in accordance with Law, Good Industry Practice, the Planning Approvals, all guidelines made or approved by the EPA and any other requirements of this deed;*

(iii) *be reviewed and approved by a Certified Contaminated Land Consultant; and*

(iv) *characterise the risk of Contamination migrating from the Construction Site as a result of the Tunneling Contractor's Activities;*

(d) *In addition to the requirements set out in clause 12.19(c), each Detailed Site Investigation performed within an Area of Contamination Concern must:*

(i) *To be reviewed and endorsed by an Accredited Site Auditor; and*

(ii) *Be accompanied by an Interim Site Audit Advice prepared by the Accredited Site Auditor when submitted to the Principal's Representative and the Independent Certifier in accordance with clause 12.19(a).*

(e) *In addition to the requirements set out in clauses 12.19(c) and 12.19(d), each Detailed Site Investigation performed within a Key Contaminated Area must in accordance with the relevant EPA guidelines:*

(i) *determine and delineate the lateral and vertical extent of Contamination within each Key Contaminated Area;*

(ii) *include in-situ classification of Solid Waste at sampling densities not less than that specified within the NEPM (2013) and the Industrial Waste Resources Guidelines (7), Sampling and Analysis: Soil Sampling (EPA Victoria 2010), except for Virgin Excavated Natural Material (VENM) and Excavated Natural Material (ENM) which are to be classified in accordance with the requirements of the Protection of the Environment Operations Act 1997 (NSW);*

(iii) *classify the Solid Waste in accordance with the Waste Classification Guidelines using a statistical approach where relevant;*

(iv) *be suitably detailed so as to inform the development of the Remediation Action Plan, any Remediation Cost Estimate and any Agreed Remediation Scope and to characterise contamination risk to the construction, operation and maintenance of Sydney Metro West (including but not limited to soil, groundwater, ground gas, vapour and odour risks arising from Contamination within the area of proposed excavation or disturbance or migrating into the area of proposed excavation or disturbance).*

1.5 Scope of Works

The scope of works undertaken in order to meet the objectives, as outlined within the SAQP (ERM, 2022) included the following tasks:

- Project preliminaries including preparation of a site specific Health and Safety Plan (HASP) and completion of subsurface utility clearance requirements;
- Review of background information relating to the Site, including:
  - Previous investigations relating to site contamination;

- The NSW Environment Protection Authority (EPA) Contaminated Land Register;
- The NSW EPA Record of notices;
- Historical aerial photographs;
- Groundwater bore information;
- Relevant government and other publically available databases;
- Published soil, geology and topographic maps;

- Soil investigation works included:
  - Progression of 16 boreholes within the proposed Station Box footprint, including:
    - 14 boreholes to a maximum depth of 5 metres below ground level (m BGL);
    - 2 boreholes to a maximum depth of 25 m BGL;
  - Progression of 29 boreholes within the Construction Support areas to a maximum of 3 m BGL;
- Groundwater investigation works included:
  - Gauging and sampling of one existing groundwater well onsite;
- Hazardous ground gas (HGG) investigation works included:
  - Five shallow soil bores were converted into HGG monitoring bores;
  - Two rounds of monitoring were undertaken at one week intervals following installation;
- Submission of collected soil and water samples to a National Association of Testing Authorities (NATA) accredited laboratory for the required analysis; and
- Preparation of this DSI report in general accordance with the applicable guidelines made or approved under S. 105 of the *Contaminated Land Management Act* (1997), including (but not limited to) relevant sections of the National Environment Protection *(Assessment of Site Contamination)* Measure 1999 (ASC NEPM) (NEPC, 2013) and the *Consultants reporting on contaminated land, Contaminated Land Guidelines* (NSW EPA, 2020).

1.6 Regulatory Requirements

The investigation was performed in accordance with the relevant elements of the following guidelines and standards.

- AS 4482.2 - Guide to the Sampling and Investigation of Potentially Contaminated Soil, Part 2: Volatile Substances, Australian Standard (1999);
- AS 4482.1 - Guide to the Investigation and Sampling of Sites with Potentially Contaminated Soil, Part 2: Non-volatile and Semi-volatile compounds, Australian Standard (2005);
- Australian and New Zealand Guidelines for Fresh and Marine Water Quality, Australian and New Zealand Environment Conservation Council (ANZECC) (2000);
- Australian Drinking Water Guidelines (ADWG), National Health and Medical Research Council (NHMRC) (2011);
- Australian and New Zealand Guidelines for Fresh and Marine Water Quality (ANZG) Australian and New Zealand Governments and Australian state and territory governments, Canberra ACT, Australia (2018);
- Department of Environment and Conservation NSW Guidelines for the Assessment and Management of Groundwater Contamination (2007);

- National Environment Protection (Assessment of Site Contamination) Measure 1999, National Environmental Protection Council (NEPC) (April 2013). This is hereafter referred to as 'ASC NEPM, 2013';
- NSW Environment Protection Authority (EPA) Guidelines for the NSW Site Auditor Scheme (3rd edition (2017);
- NSW EPA, Contaminated Sites, Sampling Design Guidelines (1995);
- NSW EPA, Consultants Reporting on Contaminated Land, Contaminated Sites Guidelines (2020);
- NSW EPA, Designing Sampling Programs for Sites Potentially Contaminated by PFAS (2017);
- NSW EPA, Assessment and management of hazardous ground gases, Contaminated Land Guidelines (2020). This is hereafter referred to as 'the NSW EPA HGG (2020)';
- Interim Guideline on the Assessment and Management of Perfluoroalkyl and Polyfluoroalkyl Substances (PFAS), WA Department of Environment Regulation (2017); and
- PFAS National Environmental Management Plan, Heads of Environment Protection Authority (HEPA) Version 2.0 (January 2020). This is hereafter referred to as 'the NEMP (2020)'.

2. SITE BACKGROUND

2.1 Site Description and Identification

The Site is located at the corner of Olympic Boulevard and Figtree Drive opposite the Aquatic Centre in Sydney Olympic Park, NSW 2127. The Site is currently occupied by large commercial buildings and car parks.

Site identification details are summarised in **Table 2-1** and the site location and layout are provided within **Figures 1.**

Table 2.1: Site Identification

ITEM	DESCRIPTION
Site Name	SOP Metro Construction Site
Site Address	Corner of Olympic Boulevard and Figtree Drive, Sydney Olympic Park, NSW
Legal Description	■ Lot 58 DP786296 ■ Lot 59 DP786296 ■ Lot 132 DP1189734
Site Area (approx.)	■ Station Box Area - 7,045 m^2 ■ Construction Support Area – 24,112 m^2 ■ Total Site Area – 31,517 m^2 (3.15 ha)
Local Government Area	City of Parramatta Council
Environmental Plan	State Environmental Planning Policy (State Significant Precincts) 2005
Current Zoning	B4: Mixed Use

2.2 Environmental Setting

The following subsections provide a brief overview of the environmental conditions surrounding and underlying the Site.

Detailed background information is provided within the Jacobs EIS (2020) and ERM SAQP (2022), therefore a brief description is presented in the subsections below.

2.2.1 Surrounding Land Use

The Site is located in an area primarily used for commercial / industrial land uses:

- **North** – Herb Elliot Ave followed by a gatehouse and associated gardens with heritage value, commercial/industrial properties, existing Olympic Park train station, stadiums and large paved areas beyond.
- **South** – Figtree Drive followed by commercial/industrial properties.
- **East** – Commercial/industrial properties and high density residential apartments beyond.
- **West** – Olympic Boulevard (Blvd) followed by recreational land uses (Sydney Olympic Park Aquatic Centre).

2.2.2 Topography and Hydrology

The Site is located in an area of relatively flat topography with an elevation of 24 m Australian Height Datum (AHD) generally across the Site. The Jacobs EIS (2020) describes the Site as having an overall south easterly decline towards Bicentennial Park. The nearest surface water receptor is Lake Belvedere, located approximately 500 m south east of the Site. Lake Belvedere discharges into Powells Creek located approximately 1 km to the east of the Site.

2.2.3 Geology and Soils

A review of Geological Survey of NSW 1:100 000 geological map indicates that geology underlying the Site consist of Wianamatta Group Ashfield Shales, which are described as consisting of black to dark-grey shale and laminite. The rock relationship diagram on the map indicates Hawkesbury sandstones underlying the Ashfield Shales at depth.

A review of Atlas of Australian Soils of NSW 1:100 000 geological map indicates that the Site is underlain by Sodosol soil order comprising undulating chief soils, hard acidic yellow mottled soils usually containing some ironstone gravels throughout the profile.

A review of the Soil Landscapes of central and eastern NSW geological map indicates that the Site is underlain by the Blacktown (bt) residual soil landscapes. The bt landscape is described as gently undulating rises on Wianamatta Group shales and Hawkesbury shale, with slopes <5%, broad rounded crests and ridges with gently inclined slopes. The bt soils are described as shallow to moderately deep red and brown Podzolic soils, yellow Podzolic soils and Soloths.

The following observations were made within the previous investigations:

- GHD (2010) reported between 3.5 m to 6.15 m depth of fill within three boreholes progressed at the Site and adjacent to the Site, as cited within the ERM SAQP (2022);
- The Jacobs EIS (2020) indicated that soils at the SOP Site comprise fill at depths of 0 – 2 m, underlain by residual Ashfield Shale to approximately 45 m BGL, with Hawkesbury Sandstone at depths greater than 45 m; and
- The intrusive investigation for this DSI observed fill depths between 0.2 – 1.7 m BGL.

2.2.4 Hydrogeology

A search of the WaterNSW database of registered groundwater bores undertaken by Lotsearch (**Appendix A**) and reported on 3 February 2022 did not identify any registered groundwater bores onsite. Three groundwater bores were identified 90 – 100 m north-east of the Site, registered as monitoring bores with a depth of 8.0 m BGL. Standing water levels (SWLs) were not available for these bores at the time of writing.

Several other groundwater bores were identified within a 1 km radius of the Site, with SWLs reported to be 1.8 – 1.83 m BGL within the closest cluster of groundwater wells. The SWLs within the other surrounding wells were not available.

Based on a groundwater monitoring report provided to ERM for review (GDP, 2018[3]), two sets of nested wells (one shallow ~4.5 m BGL and one deep ~26-30 m BGL) are located on Site. It is reported that the two shallow wells did not recharge following development, as such these wells remain dry. The deeper wells were reported to have SWLs between 12.29 and 14.44 m below top of casing (m BTOC).

The Jacobs EIS (2020) described the typical groundwater level observed to be approximately 12.0 m BGL.

The groundwater was reported to flow to the south and east. However, it is noted that groundwater flow direction is anticipated to change during the excavation of the Station Box area due to the Station Box acting as a ‘groundwater sink’ and likely dewatering activities being required to allow Station Box construction in dry conditions.

2.2.5 Acid Sulfate Soils

A review of the Acid Sulfate Soils (ASS) risk maps from the former Office of Environment and Heritage indicates the Site is located in an area described as *“No Risk”* in terms of potential ASS.

[3] Golder and Douglas Partners, *Groundwater Monitoring Report, 00013/11180 Sydney Metro West Geotechnical Investigation,* ref: 1791865-003-R-GWMR-RevA, dated 16 October 2018 (GDP, 2018).

Surrounding areas to the north-west of the Site, greater than 1 km from the Site, and outside of the zone of drawdown modelled by Jacobs Typsa (2022) are high ASS probability sediments identified as *"H0: high probability at/near ground surface"* and *"H1: high probability <1m below ground surface"*. Based on the surficial / shallow depth of potential occurrence of ASS, and these areas' proximity and hydraulic connection to surface water bodies including Powells Creek and the Parramatta River, impact to these potential ASS soils is not considered likely.

To the north and to the south of the site at a distance of at least 350 m from the station site are disturbed terrain areas identified as X2 and X4. These are disturbed estuarine environments with PASS elevations of 2-4 m and >4 m respectively. These are also mostly outside the zone of drawdown modelled by Jacobs Typsa (2022) with the exception of a portion of the X4 disturbed terrain approximately 350 m south east of the site at the 2 m drawdown contour. Oxidation of PASS soils at depth could occur in this area and groundwater quality may be impacted, however treatment of waters prior to discharge to surface water environments is planned, and monitoring of groundwater along he alignment in accordance with the groundwater management plan GWMP will enable detection of changes groundwater chemistry if they occur.

3. DESKTOP INVESTIGATION

3.1 Historical Aerial Photograph Review

Historic aerial photographs were sourced via LotSearch Pty Ltd and are presented in **Appendix A** of this report.

A summary of the historical aerial photograph review is provided in **Table 3-1** below.

Table 3.1: Historical Aerial Photograph Review

Historical Aerial Date	Description
1930	The Site is observed to be mainly an approximately triangular open space / field bordered by a line of vegetation/trees. The remaining area of the Site located to the east of the open space, is observed to be vacant land with ground disturbance across it. A large industrial site is observed to the north of the Site, with a road running between the two sites. The majority of the surrounding area is observed to comprise agricultural land, with few residential properties and some road/rail infrastructure.
1943	The triangular open space remains unchanged, with the exception of two dirt tracks across the area. Further soil disturbances, likely including earthworks, appear to have occurred in the remaining portion of the Site located to the east. Initial stages of rail infrastructure development are observed within this portion of the Site. The large industrial site appears to have been further developed, including the construction of associated smaller structures. The residential properties have been demolished and the surrounding area has been further developed into roads/rail and agricultural land.
1949	The Site appears to remain unchanged with the exception of minor ground disturbances observed across the open space area. Significant changes have not occurred within the surrounding areas.
1951	No significant changes have occurred within the open space field. A more defined railway structure has been developed within the remaining portion of the Site located to the east. Significant changes have not occurred within the surrounding areas.
1955 – 1956	No significant change is observed across the open space field. The railway infrastructure has been further developed. Soil disturbances are observable within the industrial property to the north. Minor developments associated with the rail infrastructure to the south west is observed. No significant changes are observed within the remaining surrounding land.
1961	The railway infrastructure appears to be developed and functional. No other significant changes are observed on Site. Two new warehouses or similar structure appears to have been constructed within the industrial property to the north, where the soil disturbances were observed within the previous aerial photograph. The land to the west of the industrial property is now observed to be used as a car park. Small sheds / structures have been constructed within the agricultural land surrounding the property to the south.
1965	No significant changes are observed on Site. Further road and rail infrastructure has been constructed to the south-west of the Site. It appears the construction of a building immediately east of the industrial property has occurred.
1970	Two buildings / structures have been constructed within the open space field in the southern extent of the Site. Ground disturbance appears to have occurred, and associated stockpiles and a dirt path can be observed. Further industrial development has occurred to the north of the site, including the construction of several car parks. Ground disturbance and the construction of a building is observed within the property to the south west of the Site.
1978	No significant changes have occurred within the Site. Major ground disturbance is observed to the south west of the Site. Further development of road infrastructure is also observed within the surrounding areas.
1982	No significant changes have occurred within the Site.

Historical Aerial Date	Description
	The agricultural land to the south of the Site has been cleared. No other significant changes have occurred within the surrounding areas.
1986	The railway portion across the Site appears to have been discontinued, and the infrastructure demolished. The open space field and the remaining portion of the Site has been cleared and is observed to comprise vacant land with bare soil, bar the tree line around the triangular area. It appears major earthworks have been undertaken at the Site and to the east of the Site. The cleared area to the south of the Site has been partially developed into a carpark area with associated buildings.
1991	Three buildings have been constructed on Site (the buildings currently present), and the road running immediately adjacent the northern boundary of the Site, currently Herb Elliott Ave, has been realigned. Four buildings have also been constructed immediately to the east of the Site, and two buildings have been constructed to the south of the Site. Herb Elliot Ave has been realigned and redeveloped in a loop structure around the Site and associated buildings to the east. Further agricultural land is observed to have been cleared in the surrounding areas. Some ground disturbance and dirt tracks/paths is observed within the property to the south west of the Site. Minor development is also observed to have occurred to the south of the Site.
1994	No significant changes have occurred within the Site. A large building is developed to the west/south-west of the Site, which is the currently present aquatic centre. Further road infrastructure and realignment has occurred. Further development has occurred in the land surrounding the Site to the west and south. The large industrial property to the north of the Site, has been demolished and a vacant land is observed with hardstand across it.
2000	No significant changes have occurred within the Site. Further development has occurred within the surrounding areas in relation to the development of Homebush Bay for the Sydney Olympic games of 2000, including the completion of the aquatic centre construction, the construction of Sydney Olympic Park station and associated rail infrastructure, and the Sydney Olympic Showground to the north of the Site. Realignment and redevelopment of roads has also occurred.
2005 – present	No significant changes have occurred within the Site. Minor progressive developments have occurred during this time period, however, the surroundings areas have for the most part remained unchanged.

3.2 Council and Regulatory Records

A summary of the information accessible through publicly available records and sourced via Lotsearch is summarised within **Table 3-2**.

Table 3.2: Council and Regulatory Records Search

Item	Description
Contaminated Land	The Site was not listed as contaminated under the Contaminated Land Management Act (CLM Act) 1997. Three sites listed as sites notified to the NSW EPA were identified within 500 m of the Site with ongoing maintenance required to manage residual contamination: ■ Aquatic Centre Carpark landfill located 139 m south west of the Site; ■ Former Golf Driving Range landfill located 149 m south east of the; and ■ Bicentennial Park landfill located 301 m east of the Site. The potential risk to onsite receptors from these three sources are discussed further within **Section 3.3** below.

Item	Description
	Two former 'Contaminated Land: Record of Notice' were identified for the Site and the general surrounding area of Homebush Bay. This is presumed to be in relation to the historical land uses as described within **Section 3.3.**
James Hardie Sites	The Site was not listed as a James Hardie Site. Two records of James Hardie Asbestos Waste Sites were identified to be located immediately adjacent the north western Site boundary. The address was listed as King Avenue, Showground road, Homebush with the site names King Avenue – abattoir and King Avenue – railway land. It is understood the abattoir was identified as AEI 33 within the EIS (2020).
Delicensed Activities still Regulated by NSW EPA	One delicensed activity still regulated by the NSW EPA was identified onsite: ■ Silanna Semiconductor Pty Ltd, Peregrine Semiconductor Australia Pty Ltd, 8 Herb Elliott Ave, Homebush. The activity is listed as 'hazardous, industrial or Group A Waste Generation or Storage'. ERM undertook intrusive sampling within the footprint of the regulated area and results will be discussed in **Section 7**.
Heritage	One (item was identified as an Environmental Planning Instrument (EPI) Heritage Item, located immediately adjacent the north western boundary of the Site: ■ State Abattoirs classified as Conservation Area – General. Two (State Heritage items and one EPI Heritage item were identified within a 500 m radius of the Site.
Dryland Salinity	The Site lies within an area of moderate salinity potential.
Bushfire Prone Land	The Site was not listed as a bushfire prone area.
Ecology	No Ramsar Wetland areas were identified on-site or within 1 km of the Site. Based on the data provided within the Lotsearch report, obtained from the Groundwater/Inflow Dependent Ecosystems (GDE / IDE) Atlas by the Bureau of Meteorology, a high potential GDE and an IDE with a 8 – 10 likelihood are located approximately 500 m north east of the Site.

3.3 Historical Land Use

A review of the Historical Business Directories provided by Lotsearch for the years 1950 – 1991 indicated the Site was used by the following entities for a variety of business activities:

- Alfa Laval Engineering Pty Ltd – tank, filter, heat exchanger, separator, valve, dairy machinery and pumping equipment manufacturing, dairy factory supplies and engineers' abattoirs.
- AWA Microelectronics Pty Ltd – electronic components manufacturers / imports and distributions.
- Sanyo Australia Pty Ltd Australia – video equipment manufacturers and distributors.

Based on publicly available information, previous land uses also included railway and road infrastructure, and the land was redeveloped for the 2000 Olympic Games.

As aforementioned, three contaminated sites notified to the EPA are present within a 500 m radius of the Site. Bicentennial Park landfill is currently considered to be located hydraulically down-gradient of the Site, and therefore is not considered likely to pose a risk for the current land use. However, the groundwater flow directions are presumed to change following commencement of dewatering. As such, the potential risk posed cannot be ruled out at this stage.

The 'Golf Driving Range' landfill is located approximately 150 m south and the landfill beneath the Aquatic Centre car park is located approximately 150 m south west. Both landfills are currently managed and therefore are likely low risk in terms of potential landfill gas migration onto the Site. The landfills are located hydraulically down gradient, based on data from previous investigations.

However, based on the close proximity to the Site and the proposed dewatering anticipated to change the groundwater flow direction, it is considered a potential risk exists pertaining to leachate-contaminated groundwater being drawn towards the Station Box as a result of dewatering. Therefore, the land uses considered the most significant for the proposed Sydney Metro construction works are the three landfills located surrounding the Site.

3.4 Site History Summary

Based on a review of the historical aerial photographs, the Site was observed to be mainly open space and rail infrastructure until circa 1986, when the railway was discontinued and the infrastructure demolished. The Site was cleared with the exception of the tree line around the Site, and it appears major earthworks have been undertaken on Site. The buildings currently present on Site, appears to have been constructed circa 1991 and remain unchanged since.

The surrounding areas predominantly comprised agricultural land and road/rail infrastructure with one large industrial compound to the north of the Site. The industrial compound and associated areas to the north were developed until circa 1970 and remained unchanged until circa 1994 when it was demolished. The surrounding areas were progressively developed into the commercial/industrial area currently present during the 1990s for the Sydney Olympic Games of 2000, and has not undergone significant changes since.

Three sites listed as NSW contaminated sites notified to the EPA were identified within 500 m of the Site, Bicentennial Park landfill located south east of the Site, ‘Golf Driving Range’ located south of the Site, and Aquatic Centre car park located south west of the Site. Based on the close proximity to the Site and the proposed dewatering anticipated to change the groundwater flow direction potentially making these sites hydraulically up gradient, it is considered a potential risk exists pertaining to leachate-contaminated groundwater being drawn towards the Station Box as a result of dewatering. Therefore, the land uses considered the most significant for the proposed Sydney Metro construction works are the three landfills located surrounding the Site.

Two records of James Hardie Asbestos Waste sites were identified to be located immediately adjacent the northern boundary of the Site. One delicensed activity still regulated by the NSW EPA was identified on Site, Silanna Semiconductor Pty Ltd. The activity is listed as ‘hazardous, industrial or Group A Waste Generation or Storage’.

4. PREVIOUS INVESTIGATIONS

The previous investigation undertaken at the Site or relevant to the Site are listed below. It should be noted that, at the time of writing, the GDP (2020) report were not available for review by ERM.

- Golder-Douglas Partners, *Groundwater Monitoring Report, 00013/11180 Sydney Metro West Geotechnical Investigation*, ref: 1791865-003-R-GWMR-RevA, dated 16 October 2018 (GDP, 2018).
- Golder-Douglas Partners, *Groundwater Monitoring Report – Stage 2 Locations, Sydney Metro West Geotechnical Investigation*, ref: 1791865-023-R-GWM Stage 2 Rev1, dated 20 May 2021 (GDP, May 2021).
- Golder-Douglas Partners, *00013/11180 Sydney Metro West Groundwater Monitoring Report – Stage 3 Locations*, ref: 1791865-026-R-GWM Stage 3-RevC, dated 12 June 2021 (GDP, June 2021).
- Jacobs (2020) Sydney Metro West Environmental Impact Statement – Westmead to The Bays and Sydney CBD, Ref. IA19980, dated 15 April 2020 (Jacobs EIS, 2020).

- ERM, Sampling Analysis and Quality Plan, Sydney Olympic Park Station Construction Site, Sydney Metro West: Central Tunnelling Package, Project no: 0628507, dated 24 January 2022 (ERM SAWQP, 2022).
- Jacobs Typsa (2022) Sydney Metro West – Central Tunelling Package Sydney Olympic Park Excavation – Station Shaft, dated 23 March 2022 (Jacobs Typsa, 2022).

A summary of relevant investigations where data or information relevant to the Site was collected or discussed is provided within the sections below.

4.1 GDP (2018)

A summary of the relevant findings is provided below:

GDP installed two sets of groundwater monitoring wells (BH015 and BH068) at the Site as part of a larger groundwater monitoring program across several sites. Each set of groundwater wells comprised a shallow well and a deep well installed approximately 1 m apart.

It is reported that following development of the shallow wells, groundwater recharge was not observed and the wells remained dry. The two deeper wells were installed to depths of 29.2 m BGL (BH015) and 26.1 m BGL (BH068).

BH015 reported concentrations of nitrate and nickel in groundwater above the adopted drinking water guidelines and ammonia and cobalt were reported above the adopted 95% marine ecological criteria.

BH068 was reported to be obstructed and therefore was unable to be sampled by GDP. However, SWLs were obtained via a data logger.

Two offsite groundwater wells immediately surrounding the Site, were also installed by GDP (BH019 and BH032). BH019 reported concentrations of metals and ammonia in groundwater above adopted ecological criteria, nitrate above the adopted drinking water guidelines, and dissolved methane above the adopted screening criteria of British Geological Survey (2018). BH032 reported a concentration of ammonia above the adopted ecological criteria and nitrate above the adopted drinking water guidelines.

4.2 Jacobs EIS (2020)

The Jacobs EIS (2020) Chapter 20.10 states the following pertaining to the Stage 1 construction works:

"Overall, the groundwater and landfill gas in the vicinity of the construction site and tunnel alignment have a high potential contamination risk associated with current and historical activities."

Jacobs suggested that further data review was required and an appropriate management approach implemented in accordance with the measures in Section 20.17, which are in summary, as follows:

- Stage 1 contamination impacts would be managed in accordance with the Construction Environmental Management Framework in place for the Site, which is stated to require the preparation of a Soil and Water management plan which would include management measures for contaminated material and a contingency plan in the event an unexpected finds (UF) is identified.
- Mitigation measures to address potential contamination risks associated with Stage 1 works are listed under five categories:
  - C1 – management of low risk contamination: For sites where potential contamination risk is moderate to very high, a further review of data is to be undertaken. In the event, the additional review determines the contamination if likely to have very low or low risk, the site will then be managed in accordance with the Soil and Water Management Plan.
  - C2 – detailed site investigation: In the event, the additional data review is insufficient to understand the risk of contamination a DSI will be required to be undertaken in accordance with ASC NEPM (2013).
  - C3 – remediation: Where data from the additional data review (C1) or the DSI confirms that contamination would be moderate to very high risk, a RAP would be required.
  - C4 – site audit statement (SAS): Where contamination is highly complex, an accredited Site Auditor would be required to review and approve the RAP and develop a SAS and Site Audit Report upon completion of remediation.
  - C5 – residual contamination following construction: Ongoing management and monitoring measures would be required to be documented in an appropriate form and implemented for any areas where minor residual contamination remains following construction.

4.3 Jacobs Typsa (2022)

This design report provides design information relating to the construction of the retention system for the Sydney Olympic Park Station Box. The report includes information relevant to this DSI, in particular, the Contamination Assessment Report and the Hydrogeological Assessment Report, which are provided as Appendix F and Appendix G of the document respectively.

The Contamination Assessment Report included the screening of soil and groundwater results from historical investigations against human health and ecological criteria. There were no exceedances of the human health criteria for soil samples at the site. There were, however, some exceedances of the ecological criteria within the on-site soil dataset. The groundwater data did not have concentrations of any constituents above the human health criteria. This includes data from both on and off-site monitoring wells. There were several exceedances of the ecological criteria in groundwater samples from both on-and off-site monitoring wells.

The Hydrogeological Assessment Report contained information on the groundwater levels and flow, which was reported to be towards the west, and contained the results of in-situ permeability (packer) tests and slug tests. Groundwater inflow and drawdown from the proposed dewatering were also re-modelled. The potential for groundwater impacted from nearby landfills to be drawn towards the station excavation was explored in the context of the hydrogeological conceptual site model, and found to be possible between 3 years and 20 years post excavation, however it was considered unlikely that contaminated groundwater would migrate to the station given the nearby landfills were designed with liners and include leachate management systems.

5. SAMPLING AND ANALYSIS QUALITY PLAN

5.1 Data Quality Objectives

The ERM SAQP (2022) was prepared for this investigation to define the type and quality of data required to achieve the objectives detailed within **Section 1.3**.

The approach adopted was consistent with the ASC NEPM 2013 Data Quality Objectives (DQO) process, as outlined in Schedule B2 *Guideline on Site Characterisation,* the Australian Standard AS4482.1 Guide to the Sampling and Investigation of Potentially Contaminated Soil, and the Quality Control requirements detailed within the HEPA (2020) NEMP.

The DQOs developed and presented in the SAQP (ERM, 2022) using the seven step DQO approach are summarised in the subsections below.

5.1.1 Step 1: State the Problem

Given the proposed development works for the Site, the Site is to be assessed during the DSI for suitability for a land use consistent with the definition of 'Commercial/Industrial' provided in the ASC NEPM 2013. To provide a complete characterisation of the Site in accordance with ASC NEPM and NSW EPA guidance, spatial coverage should be sufficient for confidence that the Site data is representative.

Furthermore, a waste classification is required for spoil to be excavated from the Station Box in accordance with the Waste Classification Guidelines (NSW EPA, 2014). As such, this investigation is required to satisfy the minimum sampling densities as outlined within Section 12.19 (e) (ii) of the Deed, which specifies a sampling density for in-situ classification of no less than Industrial Waste Resources Guidelines (IWRG) 7, Sampling and Analysis: Soil Sampling (EPA Victoria 2009). Virgin Excavated Natural Material (VENM) and Excavated Natural Material (ENM) are to be classified in accordance with the requirements of the NSW Protection of the Environment Operations Act 1997.

It should be noted that however, the in-situ waste classification was prepared separately by others.

5.1.2 Step 2: Identify the Decision

Based upon the objectives of the investigation detailed **Section 1.3**, the decisions required to meet the objectives are discussed below:

- Is there sufficient information on the distribution and characteristics of impacted soil, groundwater and ground gas across the site to evaluate risk of harm to human health or the environment and whether off-site migration of contamination may have occurred?
- Is there sufficient information collected for the accurate in-situ waste classification for material within the Station Box footprint?
- Are there any potential unacceptable risks to human health and / or ecological receptors from contamination impacts in soil, groundwater and/or ground gas?
- Is there any evidence of, or potential for, migration of contaminants from the site?
- Is management or remediation of contamination, if identified, required?
- Is there sufficient information on the distribution and characteristics of contaminated soil, groundwater and HGG across the site to develop a Remedial Action Plan (RAP) or Environmental Management Plan (EMP) to (where necessary) remediate and/or manage site contamination?

5.1.3 Step 3: Identify inputs to the Decision

The inputs to make the above decisions include:

- An understanding of the nature, type and distribution of potentially contaminating activities that are currently and have historically occurred at the Site.
- Review of available historical reports, including geological and hydrogeological data, lithological records and previously collected field and analytical data.
- Soil and groundwater data providing characterisation on the nature and extent of contamination.
- Screening-level assessment criteria from guidelines made or approved by the relevant regulatory authorities as detailed within **Section 6**.
- Confirmation of acceptable data quality by assessment of data quality assurance / quality control by comparison against Data Quality Indicators (DQIs).

5.1.4 Step 4: Define the Study Boundaries

The boundaries of the investigation are identified as follows:

- Spatial boundaries – the investigation is limited to the area illustrated within **Figure 1** and the maximum depth of investigation at each location.
- Constraints within the study boundaries: the following are limitations of the sampling strategy for the site:
  - Access restrictions associated with sites conditions e.g. sites boundary fencing, safety concerns related to sampling within indoor areas, potential operational restrictions, the presence of and / or uncertainties related to the potential for underground utilities and presence of building structures.

Potential contamination at the site was not expected to be significantly affected by short-term temporal conditions and, as such, the data is considered representative of conditions at the time and duration of the investigation.

5.1.5 Step 5: Develop a Decision Rule

The decision rules are outlined as follows.

Table 5.1: Decision Rules

Decision No.	Decision	Decision Rules
1	Is there sufficient information on the distribution and characteristics of contaminated soil, groundwater and ground gas across the site to evaluate risk of harm to human health or the environment and whether off-site migration of contamination may have occurred?	■ Based on the identified potential risks detailed within the CSM, does the sampling density provide sufficient coverage within and surrounding potential source areas to assess whether contamination is present, if so, the answer to the decision is 'Yes'. ■ Otherwise, the answer to the decision is 'No'. If the answer is 'No', additional investigation will be required.
2	Is there sufficient information collected for the accurate in-situ waste classification for material within the Station Box footprint?	■ Based on the volume of fill anticipated to be produced and in comparison with the adopted minimum sampling densities, sufficient samples have been collected and analysed, the answer to the decision is 'Yes'. ■ Otherwise, the answer to the decision is 'No'. If the answer is 'No', additional investigation will be required.

Decision No.	Decision	Decision Rules
2	Are there any potential unacceptable risks to human health and/or ecological receptors from fill/soil, groundwater and/ or ground gas?	Analytical data compared against adopted assessment criteria: ■ If one or more concentrations of contaminants at one or more sampling locations are reported above the adopted assessment criteria and relate to a potentially complete pathway, then the answer is 'Yes'. ■ If all concentrations of contaminants are reported to be equal to or below the adopted assessment criteria, the answer is 'No'. Statistical analysis of data sets of chemical CoPC analyte concentrations will be used as inputs should sufficient data be collected, consistent with guidance in the NEMP and ASC NEPM. The analysis shall include: ■ 95% upper confidence limit (UCL) of the arithmetic mean concentration of each analyte shall be less than or equal to the criterion. ■ The maximum concentration of each analyte shall be less than or equal to 250% of the criterion. ■ The standard deviation of each analyte shall be less than 50% of the criterion. If any of these are exceeded, then the answer to the decision is 'Yes'.
3	Is there any evidence of, or potential for, migration of contaminants from the site?	■ Where the assessment identifies the potential for unacceptable risks to off-Site receptors as a result of Site contamination conditions, the answer to the decision is 'Yes'. ■ Otherwise, the answer to the decision is 'No'.
4	Is management or remediation of contamination, if identified, potentially required?	■ If the answer to Decision 2 is 'Yes', then management or remediation of identified contamination may be required.
5	Is there sufficient information on the distribution and characteristics of contaminated soil and groundwater across the site to develop a Remedial Action Plan or Environmental Management Plan to (where necessary) remediate and/or manage site contamination?	■ Is further assessment required to delineate the nature and extent of identified contamination within the site or migrating off-site? ■ If no additional investigation is required, the answer to the decision is 'Yes'. ■ Otherwise, the answer to the decision is 'No'.

5.1.6 Step 6: Specify Limits of Decision Error

This step is to establish the decision maker's tolerable limits on decision errors, which are used to establish performance goals for limiting uncertainty in the data. Data generated during this project must be appropriate to allow decisions to be made with confidence.

Specific limits for this project have been adopted in accordance with the guidance provided by the ASC NEPM, the NEMP, and standard ERM procedures for field sampling and sample handling.

To assess the usability of the data prior to making decisions, the data will be assessed against pre-determined DQIs for precision, accuracy, representativeness, comparability and completeness.

The pre-determined DQIs established for the project are discussed below in relation to precision, accuracy, representativeness, comparability, completeness and sensitivity.

- **Precision** – measures the reproducibility of measurements under a given set of conditions. The precision of the laboratory data and sampling techniques is assessed by calculating the Relative Percent Difference (RPD) of duplicate samples.
- **Accuracy** – measures the bias in a measurement system. The accuracy of the laboratory data that are generated during this project is a measure of the closeness of the analytical results obtained by a method to the 'true' value. Accuracy is assessed by reference to the analytical results of laboratory control samples, laboratory spikes and analyses against reference standards.
- **Representativeness** – expresses the degree with which sample data accurately and precisely represent a characteristic of a population or an environmental condition. Representativeness is achieved by collecting samples on a representative basis across the site, and by using an adequate number of sample locations to characterise the site to the required accuracy.
- **Comparability** – expresses the confidence with which one data set can be compared with another. This is achieved through maintaining a level of consistency in sampling techniques, analytical techniques and reporting methods.
- **Completeness** – is defined as the percentage of measurements made which are judged to be valid measurements. The completeness goal is set at there being sufficient valid data generated during the study.
- **Sensitivity** – expresses the appropriateness of the chosen laboratory methods, including the limits of reporting, in producing reliable data in relation to the adopted assessment criteria.

If any of the DQIs are not met, further assessment will be necessary to assess whether the non-conformance will significantly affect the usefulness of the data. Corrective actions may include requesting further information from samplers and/or analytical laboratories, downgrading of the quality of the data or alternatively, re-collection of the data.

Table 5.2: Data Quality Indicators

Data Quality Objectives	Frequency	Data Quality Indicator
Precision		
Blind duplicates (intra laboratory)	■ 1 / 20 primary samples	■ <30% RPD or <50% if less than 10x LOR
Blind duplicates (inter laboratory)	■ 1 / 20 primary samples	■ <30% RPD or <50% if less than 10x LOR
Blind duplicates (intra laboratory) – PFAS	■ 1 / 10 primary samples	■ <30% RPD or <50% if less than 10x LOR
Blind duplicates (inter laboratory) - PFAS	■ 1 / 10 primary samples	■ <30% RPD or <50% if less than 10x LOR
NATA accredited laboratory method for required analysis	■ All samples	■ All samples
Accuracy		
Surrogate spikes	■ All samples	■ 70-130%
Laboratory control samples	■ 1 per lab batch	■ 70-130%
Matrix spikes	■ 1 per lab batch	■ 70-130%

Data Quality Objectives	Frequency	Data Quality Indicator
Representativeness		
Sampling appropriate for media and analytes	■ NA	■ NA
Samples extracted and analysed within holding times.	■ NA	■ Meet analyte specific laboratory holding time requirements
Rinsate blank	■ 1 per day per media sampled with re-useable sampling equipment	■ <LOR
Method blank	■ 1 per lab batch or 1 per day (whichever is greater)	■ <LOR
Comparability		
Standard operating procedures for sample collection & handling	■ All samples	■ All samples
Standard analytical methods used for all analyses	■ All samples	■ All samples
Consistent field conditions, sampling staff and laboratory analysis	■ All samples	■ All samples
Completeness		
Sample description and COCs completed and appropriate	■ All samples	■ All samples
Appropriate documentation	■ All samples	■ All samples
Satisfactory frequency and result for QC samples	■ All QA/QC samples	■ -
Data from critical samples is considered valid	■ All samples	■ All samples
Limits of reporting appropriate and consistent	■ All samples	■ All samples

5.1.7 Step 7: Optimise the Design for Obtaining Data

Historic uses of the Site indicate the potential for contamination to be present that may pose a potential risk to human health or the environment.

Various strategies for developing a statistically based sampling plan are identified in the ASC NEPM 2013 including judgemental, random, systemic and stratified sampling patterns. Based on the history of the Site and the proposed construction works, a stratified sampling program was considered appropriate to enable the accurate characterisation across the Site. Soil, groundwater and HGG sampling / monitoring locations are provided within **Figure 3** and **4**.

The rationale for the adopted sampling approach is described within **Section 5.2** and details on the investigation methodology is presented within **Section 5.3.**

5.2 Investigation Rationale

5.2.1 Soil

The soil sampling program was designed to assess the Site for suitability for a land use consistent with the definition of 'commercial / industrial' provided within ASC NEPM 2013 and to obtain sufficient data to enable waste classification of the material within the Station Box Area for off-site disposal.

The sampling density adopted for Site suitability was in accordance with the NSW EPA (1995) *Sampling Design Guidelines*, as recommended within ASC NEPM 2013. In general accordance with NSW EPA (1995) a minimum of 45 sample locations are required for an area of 3.15 ha. The boreholes were located to provide sufficient spatial coverage of the Site.

The sampling density recommended for waste classification purposes in accordance with Table 3 of the *Victorian EPA Industrial Waste Resource Guidelines: Soil Sampling* (2009) referenced within the NEPM, the sampling density requirement for in-situ material >2,500 m^3 in volume, is 1 sample per 250 m^3 to calculate the 95% UCL average. The Station Box excavation is proposed to generate a volume of 6,340 m^3 fill material (based on an average depth of 0.9 m BGL). As such, a minimum of 25 samples were required to characterise the waste sufficiently.

The below table outlines the approximate volumes of spoil proposed to be excavated from the Station Box and Station Access Excavation and the calculated sample density that is required to be achieved within this DSI.

Table 5.3: Fill & Natural Soil Sample Summary

Material Type	Approximate Volume (m^3)	IWRG (2009) Table 3 Minimum number of samples 95% UCL average
Fill	6,340 [1]	25
Natural Soils/Rock	581,100 [2]	2,324 [3]

[1] The approximate volume of anticipated Fill has been calculated on the basis of fill being encountered from 0 – 0.9 m BGL (on average).

[2] The approximate volume of anticipated natural material has been calculated on the assumption that the Station Box will be excavated to a depth of 25 m BGL.

[3] If the rock/natural soil is VENM or ENM, IWRG sample density requirements do not need to be met.

5.2.2 Groundwater

Several accessible groundwater monitoring wells were sampled as part of this DSI or as part of the baseline groundwater sampling program of works. Sampling of existing well (SMW_BH015) was not accessible, however the historical groundwater information was available for this well and other locations and used to inform the conceptual site model. The combined dataset was considered sufficient to gain an understanding of the groundwater conditions at the site for the purposes of this DSI.

An off-site groundwater investigation program comprising installation of three pairs of shallow and deep groundwater wells was proposed to be undertaken within the ERM SAQP (2022). However, due to constraints with permitting requirements with the landowner, Sydney Olympic Park Authority (SOPA), the groundwater investigation program was unable to be conducted as part of this DSI. These off-site locations (which are being installed at the time of writing) are sentinel wells designed to enable collection of data during the dewatering and are not required to assess current site suitability – but to monitor future groundwater conditions.

5.2.3 Hazardous Ground Gas

The HGG assessment across the Site was designed to obtain data on landfill gas migration from off-site sources. Landfill gas screening was undertaken to provide quantitative field screening for methane, carbon monoxide, hydrogen sulfide and carbon dioxide within the Site.

5.3 Investigation and Analysis Methodology

Fieldwork was undertaken by ERM Environmental Scientists between 12 January 2022 and 22 March 2022 in accordance with the scope of works outlined in Section **1.3** and ERM's Standard Operating Procedures (SOPs).

5.3.1 Soil Investigation

Prior to undertaking intrusive works, based on the potential for unknown services to be present within the Site, a review of available service plans including Dial Before You dig (DBYD) was undertaken and proposed drilling locations were cleared by an experienced underground utility locator with radio detection and Ground Penetrating Radar (GPR) equipment.

The soil investigation consisted the following:

- Progression of a total of 16 boreholes within the proposed Station Box footprint using a combination of non-destructive drilling (NDD) and a drill rig utilising solid flight augers, to the following depths:
  - 14 boreholes to a maximum depth of 5 mBGL;
  - 2 boreholes to a maximum depth of 25 mBGL (air hammering was utilised, where required).
- Soil samples from the soil bores within the Station Box was collected from near the surface (<0.1m), at each vertical metre within the fill, and every 5m thereafter. In the event a different lithological or fill layer was observed, a soil sample was collected.
- Progression of 29 boreholes within the Construction Support areas using a combination of NDD (high pressure water and vacuum, and hand auger for sampling) and a drill rig utilising solid flight augers, to a maximum depth of 3 m BGL. Progression via push tube sampling was not completed due to the presence of shallow bedrock. Test pits were considered within the SAQP and were only considered necessary if anthropogenic material was observed within fill during drilling.
- Two soil samples were collected from each soil bore within the Construction Support area, based on field observations.
- Soil logging was conducted by a suitably qualified and experienced ERM environmental scientist in general accordance with the Unified Soil Classification System and ERM SOPs. Samples were logged, and the following information was recorded in the field: soil/rock type, colour, grain size, sorting, angularity, inclusions, moisture condition, structure, visual signs of contamination (including staining and observations of anthropogenic material including fragments of fibre cement sheeting) in general accordance with AS1726. When samples were required to be collected in the upper 1.5m where NDD was utilised, the high pressure water/vacuum was stopped short of the sample depth, and the sample was collected using a hand auger. The method of sample collection was deemed appropriate. Using this method, soil could be inspected regularly, and water from NDD did not impact on the samples obtained. Bore hole logs are provided within **Appendix B**.
- Soil samples were placed in a zip lock bag and screened in the field for head space vapours (principally, volatile organic compounds (VOCs) but may also include some volatile inorganic compounds) using a calibrated photo-ionisation detector (PID). The sensor bulb used in the PID had an ionisation potential (IP) of 10.6 electronvolts (eV). Field records showing calibration details are provided in **Appendix C**.
- A minimum of 2 samples per location were selected for analysis based on field observations and screening, with a total of 99 soil samples submitted for analysis. Samples collected were placed within laboratory-supplied containers / sample bags and transported to a NATA accredited

laboratory under appropriate chain-of-custody (COC) documentation, for analysis for the contaminants of potential concern (CoPC) as described within **Table 5-4**.

- Field QA/QC samples were collected including field duplicates, inter-laboratory duplicates, rinsate blanks, trip blanks and trip spikes as outlined within **Table 5-4.**

5.3.2 Groundwater Investigation

The groundwater investigation consisted of gauging and sampling of five existing off-site wells, SMW_BH019, SMW_BH032, SMW_BH120, SOP_W1_w and an unknown well which has been named Sub_W1 in this report:

- Prior to sampling, the SWL and total well depth was gauged using an oil/water interface probe from the top of well casing.
- The well was purged and sampled using a peristaltic pump. During sampling measurements of field parameters including Dissolved Oxygen (DO), Electrical Conductivity (EC), reduction / oxidation potential (redox), pH, and temperature were collected. Field records and calibration details are provided within **Appendix C**.
- The collected samples were placed into laboratory provided sample containers and stored with a cooler box for transport to the laboratory under appropriate COC documentation. The samples were submitted to NATA accredited laboratory for analysis as described within **Table 5-4.**

As Sub_W1 contained very little water, the well was not purged prior to sampling and a bailer was used to collect a sample. Water collected was only sufficient to allow the analysis of a portion of the planned analytical suite.

It should be noted that the sampling of some of the off-site wells was undertaken as part of a wider sampling program.

5.3.3 Hazardous Ground Gas Investigation

The HGG assessment consisted the following:

- A total of five shallow soil bores advanced were converted to HGG monitoring wells. HGG monitoring wells were constructed within the bores in accordance with NSW EPA (2019) *Guidelines for the Assessment and Management of Sites Impacted by Hazardous Ground Gases*, using a slotted un-plasticised polyvinyl chloride (uPVC) screen positioned within the unsaturated zone, blank uPVC riser to the surface, 1 m bentonite grout seal at the surface, a flush gatic cover concreted in place to withstand light traffic and equipped with gas taps.
- The wells were left for seven days to stabilise prior to first round of monitoring, and the second round of monitoring was undertaken seven days following the first round. The third round of sampling was conducted six weeks after the second round of sampling.
- HGG monitoring was conducted using a GA5000 HGG monitor.
- Inert tubing was attached to the landfill gas monitor (GA5000) and in a location unlikely to be affected by landfill gas, to assess the background conditions of the Site and surrounds. GA5000 calibration certificate is provided within **Appendix C.**
- The gas monitor was connected to the HGG monitoring well cap and flow within the bore and atmospheric pressure recorded. The pump was turned on and the peak and stabilised concentrations of methane, carbon dioxide, carbon monoxide and hydrogen sulfide was recorded. The minimum and the stabilised concentration of oxygen and the %v/v balance (the non-analysed volume of gas taken from the bore into the analyser, representative of nitrogen and argon) was also recorded. The GA5000 was run for a minimum 10-minute period.

5.3.4 Decontamination

Decontamination of the down hole drilling equipment (casing, augers and sampler) was conducted prior to drilling the first hole and between locations by initially spraying with water using a high pressure hose, then applying Liquinox solution, and then rinsing using the high pressure hose. Dedicated disposable nitrile gloves were used for sample collection, and replaced between each sample and location. Equipment suitable for the purposes of this investigation were used (for example HDPE tubing suitable for sampling groundwater to be analysed for PFAS).

Quality control samples to assess potential cross contamination were collected during the sampling program as described within **Sections 5.3.6.**

5.3.5 Analytical Schedule

Soil and groundwater samples, including intra-laboratory duplicate samples, were analysed by ALS Limited laboratory. Inter-laboratory samples were analysed at Eurofins Scientific laboratory. Both laboratories held NATA accreditation for the analyses performed.

Table 5.4: Analytical Schedule

Location / Purpose	No. of Sample Locations	Primary Samples	Analytical Analysis[1]
Soil			
Construction Support Area	29	56	TRH, BTEXN, Metals (8), PAHs, PCBs, OC, OP
		29	VOCs (50% of samples collected)
		13	PFAS (LOR 5 µg/kg) (25% of samples collected)
		30	Asbestos ID (AS4964) (one sample from fill material per borehole)
Station Box Area	16	43	TRH, BTEXN, Metals (8), PAHs, PCBs, OC, OP
		21	VOCs (50% of samples collected)
		34	PFAS (LOR 5 µg/kg) (1xfill and 1xrock sample per borehole)
		16	Asbestos ID (AS4964) (one sample from fill material per borehole)
		13	Toxicity Characteristic Leaching Procedure (TCLP) - Nickel
Site coverage	5	5	Total organic carbon (TOC) (3 x fill and 2 x natural)
	3	3	pH and cation exchange capacity (CEC)
Groundwater			
On-site	2	2	TRH, BTEXN, Metals (8), PAHs, VOCs, PFAS Ammonia, nitrate, total nitrogen, total phosphorous, major anions and cations, total dissolved solids (TDS), dissolved methane. PFAS only at one location due to lack of water volume.

Location / Purpose	No. of Sample Locations	Primary Samples	Analytical Analysis[1]
Off-site	3	3	TRH, BTEXN, Metals (8), PAHs, VOCs, PFAS Ammonia, nitrate, total nitrogen, total phosphorous, major anions and cations, total dissolved solids (TDS), dissolved methane.

[1] Total recoverable hydrocarbons (TRH), benzene, toluene, ethylbenzene, xylene, naphthalene (BTEX), Arsenic, Barium, Cadmium, Chromium, Lead, Mercury, Nickel and Zinc (Metals), Polycyclic aromatic hydrocarbons (PAHs), Polychlorinated biphenyls (PCBs), Organochlorine (OC) pesticides, Oragnophosphates (OP) pesticides, volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs) and per- and polyfluoroalkyl substances (PFAS).

5.3.6 Quality Assurance / Quality Control

In the course of this investigation a number of QA/QC measures were implemented to check the accuracy, precision and overall validity of the results obtained. These include:

- Collection of nine duplicate and five blind duplicates (inter-laboratory) duplicate soil samples, and collection of two duplicate water samples for assessment of intra- and inter-laboratory precision;
- Collection of eight trip blanks and eight trip spikes during soil and groundwater investigations to assess the potential for loss or transfer of volatiles during sample storage and transport;
- Collection of eleven equipment rinsate blank samples for assessment of decontamination procedures;
- Internal laboratory QA/QC procedures:
  - method blanks;
  - laboratory duplicates;
  - laboratory control samples;
  - matrix spike samples;
  - surrogate recovery samples; and
  - analysis holding time reviews.

Calibration certificates for field instruments are presented in **Appendix C**, and laboratory QA/QC procedures and results are presented in **Appendix E**.

6. SITE ASSESSMENT CRITERIA

6.1 Overview

This detailed investigation was undertaken with reference to the following publications:

- National Environment Protection (Assessment of Site Contamination) Measure 1999 (ASC NEPM) (NEPC (2013);
- Health screening levels for petroleum hydrocarbons in soil and groundwater. Summary, CRC CARE Technical Report no. 10 (CRC Care, 2010);
- Technical Report no. 39, Risk-based management and remediation guidance for benzo(a)pyrene, Cooperative Research Centre for Contamination Assessment and Remediation of the Environment ('The Technical Report', CRC CARE, 2017);
- PFAS National Environmental Management Plan Version 2.0 (HEPA, 2020);
- Guidelines for Managing Risks in Recreational Water (NRHMC, 2008); and
- Australian and New Zealand guidelines for fresh and marine water quality (ANZG 2018).

6.2 Adopted Screening Levels

6.2.1 Soils

Based on the proposed future land use, ERM assessed the soil data against the 'Commercial/Industrial' land use criteria as defined in the ASC NEPM. Due to the observed underlying clays across the Site, the screening levels for clay (fine) soils were adopted. Additionally, since future green space planting above existing fill is potentially possible, the ecological investigation and screening levels for commercial/industrial land use (fine soils) were also adopted.

The adopted screening levels applicable to the assessment of soils included:

- ASC NEPM (2013):
  - Health Investigation Level (HIL) D – Commercial / Industrial
  - Soil Health Screening Level (HSL) D – Commercial / Industrial
  - Management Limits: Commercial Industrial
  - Ecological Investigation Levels (EIL) D – Commercial / Industrial (site specific values were adopted for relevant contaminants, with the exception of chromium where the most conservative value was adopted)
  - Ecological Screening Levels (ESL) D – Commercial / Industrial (fine) (except for benzo(a)pyrene criteria, for which a high reliability guidance value has been developed (CRC Care, 2017)
- CRC CARE (2011):
  - Soil HSLs for Direct Contact: HSL D – Commercial / Industrial
  - Soil Health Screening Level (HSL): Intrusive maintenance worker (shallow trench)
- HEPA NEMP (2020):
  - Human HILs for soil: Industrial/commercial (HIL-D)
  - Ecological direct exposure
  - Ecological indirect exposure

6.2.2 Aesthetic Criteria

Although no specific numeric aesthetic guideline values are provided, the ASC NEPM requires the consideration of aesthetic issues (as a result of contamination) arising from soils within the Site. The following assessment criteria have been used when considering soil aesthetics:

- No highly malodourous soils, taking into consideration the natural state of the soil at the Site; and
- No staining or discolouration in soils, taking into consideration the natural state of the soil.

6.2.3 Groundwater

The below listed criteria is used as a screening tool for the groundwater sampling results of the offsite well, BH032:

- ANZG (2018) 95% Species Protection Interim Marine Water for slightly to moderately disturbed ecosystems;
- NHMRC (2008) Recommended Recreational Guidelines for Aesthetic and Health guideline values;
- HEPA NEMP (2020) NEMP:
  - Human health guideline values for water; and
  - Recreational (NHMRC 2019).

Ecological guideline values for 99% Species Protection Interim Marine for slightly to moderately disturbed ecosystems.assessed against the following guidance:

- Assessment and Management of Hazardous Ground Gases Contaminated Land Guidelines, NSW Environmental Protection Agency (EPA), (2020).

To assess the risk posed to current or future buildings (and their occupants) by methane on the site, a gas risk assessment was performed according to the methodology set out in the NSW EPA (2020) Hazardous Ground Gases guidelines for a level 2 risk assessment (modified Wilson and Card classification). The method requires the calculation of the site Characteristic Situation score (CS) based on a Gas Screening Value (GSV) as assessed by data collected from the site. The table sourced from Table 7 of NSW EPA (2020) is provided below within **Table 6-1**. This CS score is then used to assess what protection measures are appropriate to mitigate potential risks posed by hazardous ground gases.

Table 6.1: Gas Risk Classification (modified Wilson and Card classification)

GSV threshold (L/hr)	CS	Risk Classification	Additional Factors	Typical Sources
<0.07	1	Very low risk	Typically, methane <1% v/v and/or carbon dioxide <5% v/v, otherwise consider increase to CS 2.	Natural soils with low organic content. Typical fill
<0.7	2	Low risk	Borehole flow rate not to exceed 70L/hr; otherwise consider increase to CS 3.	Natural soils with high organic content. Recent deep fill.
<3.5	3	Moderate risk		Old inert waste landfill. Flooded mine workings.

GSV threshold (L/hr)	CS	Risk Classification	Additional Factors	Typical Sources
<15	4	Moderate to high risk	Consider need for level 3 risk assessment	Mine workings susceptible to flooding. Closed putrescible waste landfill.
<70	5	High risk	Level 3 risk assessment required	Shallow, unflooded abandoned mine workings
>70	6	Very high risk		Recently used putrescible waste landfill

7. RESULTS

The following sections summaries the results of the investigation works undertaken by ERM. Sampling and monitoring locations are illustrated on **Figure 2** and **Figure 3.** Photographs of the investigation are provided within **Appendix D**. Laboratory certificates are presented within **Appendix F**.

Site work was undertaken between 12 January 2022 and 22 March 2022 in general accordance with the ERM SAQP (2022).

7.1 Subsurface Conditions and Field Screening

The fill material encountered was variable and generally comprised gravelly sand / 'road base' gravels / crushed shale and clay / coarse and fine silty and sandy clays and clayey sands. The depth of fill was observed to be varied between 0.1 and 1.7 m BGL across the Site.

Brown/red/orange and grey silty clays and clayey sands were encountered below fill material with underlying shales observed at depth. Detailed description of material encountered during intrusive investigation is described within the borehole logs provided in **Appendix B**. It should be noted that BH135 to BH138, BH141, BH143 and BH144 was terminated shallower (0.25 – 1.3) than target depth due to hand auger refusal on weathered shale, rocks or hard clay.

Results of field headspace screening of soils utilising the calibrated PID ranged from 0.1 ppm to 9.1 ppm. All PID measurements were reported equivalent to an isobutylene standard and are presented in full on the borehole logs provided in **Appendix B**.

7.2 Soil Laboratory Results

Soil analytical summary tables are provided as **Tables T1**, **T2** and **T3** within the 'Tables' section of this report.

Analytical results for soil samples are summarised below:

- Asbestos was not detected within the samples submitted for asbestos identification (AS 4964-2004[4]).
- TRH / BTEX concentrations were reported below the laboratory LOR and/or below the adopted screening criteria for all samples analysed. It should be noted that detectable concentrations of TRH (all fractions) were reported within some soil samples analysed at depth from shale within the Station Box area.
- Metals concentrations were reported below the laboratory LOR and/or below the adopted screening criteria for all samples analysed.
- PAH concentrations were reported below the laboratory limit of reporting (LOR) and/or below the adopted screening criteria for all samples analysed. However, it should be noted that detectable low level concentrations of Phenanthrene were reported within several samples analysed at depth from the rock within the Station Box Area.
- SVOCs concentrations were reported below the laboratory LOR and/or below the adopted screening criteria for all samples analysed. However, it should be noted that minor detectable concentrations of 2-Methylnaphthalene and 1,2,4-trimethylbenzene were reported within several soil samples analysed at depth from shale within the Station Box Area. Bis(2-ethylhexyl) phthalate (DEHP) was also detected within a shallow soil sample (BH141_0.4), located within the Construction Support area at a concentration of 8.7 mg/kg.
- PCB concentrations were reported below the laboratory LOR for all samples analysed.

[4] Australian Standard, *Method for the qualitative identification of asbestos in bulk samples* (AS 4964-2004).

- OC and OP concentrations were reported below the laboratory LOR and/or below the adopted screening criteria for all samples analysed.
- PFAS concentrations were reported below the laboratory LOR for all samples analysed with the exception of three shallow soil samples (BH106_0.2, BH110_0.2 and BH125_0.5).
- Total organic carbon (TOC) reported concentrations below the laboratory LOR for all samples analysed.

7.3 Groundwater Gauging and Field Parameters

Based on access restrictions the existing well onsite, BH015 and BH068 were not able to be gauged and sampled.

Groundwater gauging of the off-site wells was completed at the Site on 4 February 2022. SMW_BH032 was also sampled on this date (groundwater was sampled at SMW_BH120 and SMW_BH019 on 19 January 2022 as part of a wider groundwater monitoring program). The shallow groundwater well, SMW_BH032s, was observed to contain less than 0.2 m of standing water within the well. As such, neither field parameter measurements nor sampling was able to be conducted from this well. In later February and in mid-March, additional groundwater sampling was conducted, including the sampling of two newly identified wells (one of them was almost dry, so a very small sample volume could be obtained). The gauging results and summary of field parameters measured prior to groundwater sampling are presented below within **Table 7.1**.

Table 7.1: Summary of Groundwater Field Parameters

Date	Well ID	SWL[1] (mBTOC)[2]	SWL (m AHD)[3]	Depth to Bottom of well (m BTOC)	pH	Temp (^{0}C)	Conductivity (mS/cm)	DO (mg/L)	Redox (mV)
4/02/2022	SMW_BH019	14.45	2.88	26.16	6.66	20.4	12.57	0.77	-170.4
4/02/2022	SMW_BH032s	7.09	12.67	7.13	-	-	-	-	-
4/02/2022	SMW_BH032	9.29	10.45	22.36	7.47	20.2	15.8	5.45	152.2
19/01/2022	SMW_BH120	16.943	0.52	26.9	6.66	22.3	18.89	1.4	-139.7
21/02/2022	SMW_BH019	13.376	4.02	26.278	6.56	22.8	12.45	1.01	-21.9
15/03/2022	SMW_BH019	14.070	3.31	26.080	6.52	21.3	0.2	2.4	106.1
16/03/2022	SOP_W1_w	10.040	14.37	10.176	-	-	-	-	-
16/03/2022	Sub_W1	3.909	-	6.110	7.51	22.9	2.17	1.46	105.1

[1] Standing Water Level (SWL)

[2] meters below top of casing (mBTOC)

[3] Based on the surface elevation data provided within GDP (2018) and GDP (2020).

The groundwater parameters further indicate the groundwater in the Homebush Bay area immediately surrounding the Site was brackish. The DO concentrations indicate slightly aerobic conditions on average. A decrease in electrical conductivity during the March monitoring at SMW_BH019 was noted when compared with earlier sampling events and is potentially due to the large amount of rainfall that occurred around the time of sampling.

Based on groundwater elevation data from wells SMW_BH019 and SMW BH032 gauged during the same round of monitoring and SMW_BH120 gauged within a similar time period, groundwater was inferred to flow in a north-west / westerly direction.

It should be noted that rainfall conditions between the monitoring events were <30 mm, and therefore rainfall is not considered to have a material impact on the estimation of groundwater flow direction. The deeper wells (i.e. SMW_BH032, SMW_BH120 and SMW_BH015) were used for the groundwater elevation contouring to reflect the regional groundwater flow.

7.4 Groundwater Laboratory Results

Groundwater analytical results are provided in **Table T4** within the 'Tables' section of this report.

Analytical results for groundwater samples are summarised below:

- Total dissolved solids (TDS) was reported at concentrations above the adopted aesthetic criteria (6,000 mg/L) at three of the groundwater monitoring wells. TDS concentrations at SMW_BH019 were lower during the March 2022 sampling when compared to previous sampling rounds.
- Ammonia concentrations were above the adopted ecological criteria (ANZG (2018) 95% freshwater trigger value for an average pH of 7.4) at two monitoring wells. The ANZG (2018) trigger value for ammonia is dependent on the pH of the water and therefore the criteria has been selected for the average pH observed.
- PFAS concentrations were reported below or close to the laboratory LOR in most samples. 6:2 FTS was present in groundwater sampled from SWM_BH019 during the February monitoring round only, and several PFAS compounds were detected in the sample from Sub-W1. PFOS was also present at a concentration of 0.02ug/L in both these monitoring wells, which is above the ecological criteria adopted.
- Total phosphorous was reported at concentrations above the adopted ecological screening criteria (0.025 mg/L) within all samples analysed, with concentrations between 0.15 mg/L and 0.76 mg/L.
- Total nitrogen was reported at concentrations above the adopted ecological screening criteria (350 µg/L) within all samples analysed, with concentrations between 1,200 µg/L and 6,400 µg/L.
- Sodium and chloride concentrations exceeded the aesthetic criteria in all samples except Sub-W1, and at SWM_BH019 during the March 2022 sampling event only.
- Metals were reported at concentrations below the laboratory LOR and/or below adopted screening criteria with the exception of the following:
    - Copper within BH019 and Sub-W1 was reported a concentration above the adopted ecological screening criteria;
    - Arsenic within BH019 was reported a concentration above the adopted ecological screening criteria;
    - Iron within BH019 and BH120 was reported at concentrations above the adopted ecological screening criteria. The concentrations reported within BH019 also exceeded the adopted aesthetic criteria;
    - Nickel within Sub-W1 was reported a concentration above the adopted ecological screening criteria; and
    - Zinc within BH019 and BH032 were reported at concentrations exceeding the adopted ecological screening criteria.

7.5 Hazardous Ground Gas Field Screening

Three rounds of HGG monitoring were undertaken as part of this DSI. HGG monitoring was undertaken on 2 February 2022, 9 February 2022 and 22 March 2022. Round 1 and Round 3 were undertaken during low atmospheric pressure events. Due to the time constraints of this project, Round 2 was unable to be undertaken during a low pressure or falling atmospheric pressure events.

HGG monitoring data is tabulated and presented within **Tables T5** within the 'Tables' section of this report. The following peak readings were identified during field screening:

- Carbon dioxide readings were highest within monitoring well BH105, which recorded a maximum stabilised and peak concentration of 12.8% v/v;
- Methane readings were recorded at 0.1% v/v, same as the ambient air readings, within all monitoring wells;
- Carbon monoxide (CO) and hydrogen sulfide (H_2S) were not detected across the monitoring wells onsite; and
- The maximum flow rate observed during all monitoring events was 0.3 L/hr was observed at BH123.

7.6 Characteristic Gas Situation

Gas screening values (GSV) were calculated for CH_4 and CO_2 for all monitored wells in accordance with requirements outlined within the Ground Gas Guidelines. The GSV was also calculated assuming the worst case scenario by multiplying the maximum recorded flow rate with the maximum gas concentration in any other well as follows:

- GSV = Maximum borehole flow rate (L/hr) x Maximum gas concentration (%).

The results obtained were considered suitable for providing a quantitative indication of potential impacts from HGG on Site and calculation of preliminary GSV for the Site. The GSVs are provided within **Table 7-2** below.

Table 7.2: Gas Risk Classification

Bore	Maximum Flow (L/hr)	Maximum CH_4 (% v/v)	GSV CH_4 (L/hr)	Maximum CO_2 (% v/v)	GSV CO_2 (L/hr)	Highest Risk Classification (L/hr)	CS
BH105	0.1	0.1	0.0001	12.8	0.0128	<0.07 "very low risk"	1
BH106	0.1	0.1	0.0001	7.5	0.0075	<0.07 "very low risk"	1
BH123	0.3	0.1	0.0003	8.6	0.0258	<0.07 "very low risk"	1
BH130	0.1	0.1	0.0001	10.2	0.0102	<0.07 "very low risk"	1
BH131	0.1	0.1	0.0001	4.7	0.0047	<0.07 "very low risk"	1
Worst case	0.3	0.1	0.0003	12.8	0.0384	<0.07 "very low risk"	1

The GSV outcomes define a risk classification of "very low risk" and Situation 1. However, the NSW EPA HGG (2020) Table 7 also specifies that *"Typically methane <1% and/or carbon dioxide <5%; otherwise consider increase to CS 2".*

The quantitative assessment identified carbon dioxide at concentrations >5%, however the recorded values were consistent with the typical concentration range for oxidation of organic matter in soil [5], and methane concentrations were low (similar to the ambient air concentrations). It should also be noted that no flow rate was identified across the wells, and therefore it is considered unlikely that HGG at the Site will require management or mitigation under the CS 2 classification. In consideration of the above-mentioned factors, ERM considers that an increase to CS 2 is not warranted.

[5] Typical concentrations of oxidation of organic matter lie between 0 – 10% based on Table 2 of NSW EPA HGG (2020).

8. DATA QUALITY EVALUATION

8.1 ERM 2022 Investigation

A QA/QC assessment detailing field procedures, laboratory methods and an analysis of QA/QC sampling results from the investigation is provided in **Appendix E**. Overall, the sample data collected by ERM is considered to be of a suitable standard to be used in this report.

8.2 Previous Investigations

As the conceptual site model presented in this report will incorporate historical data from previous investigations, the quality assurance and quality assurance evaluations within the previous investigation reports were reviewed to ensure any unsuitable data is excluded from the conceptual site model evaluation. Items to note are provided in the table below.

Table 8.1: Summary of Previous Investigations

Investigation Report	Summary of Quality Assurance/ Quality Control
Golder-Douglas (2018) Groundwater Monitoring Report – Sydney Metro West Geotechnical Investigation	Golder Douglas note that although variances and non-conformances with acceptable criteria were noted, that these are considered unlikely to affect the validity of the data. The precision of most duplicates of organic compounds was acceptable and variability in PAH and TRH attributed to variance in laboratory handling, extraction and measurement procedures. SMW_BH015, SMW_BH019 and SMW_BH032 data is relevant to this DSI.
Golder-Douglas (May 2021) Groundwater Monitoring Report – Stage 2 Locations – Sydney Metro West Geotechnical Investigation	Golder Douglas note that although variances and non-conformances with acceptable criteria were noted, that these are considered unlikely to affect the validity of the data. The quality of the data was concluded to be acceptable for environmental interpretive purposes. ERM's review concurs with this assessment. SMW_BH120 and SMW_BH126 data is relevant to this DSI.
Golder-Douglas (June 2021) Sydney Metro West- Groundwater Monitoring Report – Stage 3 Locations –	Golder Douglas note that although variances and non-conformances with acceptable criteria were noted, that these are considered unlikely to affect the validity of the data. The quality of the data was concluded to be acceptable for environmental interpretive purposes. ERM's review concurs with this assessment. Just one relevant sample (SWM_ENV713) was included in the scope of works.
Jacobs Typsa (2022) Sydney Olympic Park Excavation –Station Shaft	While no data was collected by Jacobs Typsa, data from historical investigations was summarised. ERM has verified the consolidated data presented (and used in this DSI) against the original data sources for all results except SWM_ENV712, SWM_ENV712s, SWM_ENV714, AF_BH36/36s and AF_BH37/37s (as ERM does not have a copy of the original data source).

9. CONCEPTUAL SITE MODEL

9.1 Overview

A Conceptual Site Model (CSM) is the qualitative description of plausible mechanisms by which human and/or environmental receptors may be exposed to site contamination. For exposure to be considered possible, some mechanism ('pathway') must exist by which impact from a given source can reach a given receptor. This is classed as a source-pathway-receptor (SPR) linkage.

The following section presents a summary of the potential sources, pathways and receptors applicable to the Site, as well as identifying potential source-pathway-receptor (SPR) linkages, based on the groundwater data collected by Golder Douglas (2018), Golder Douglas (May 2021) and Golder-Douglas (June 2021), the soil, groundwater and ground gas data collected by ERM (2022), and information reviewed and summarised in the previous sections. The identification of SPR linkages forms a key part of developing the Conceptual Site Model (CSM) for the site.

The potential for SPR linkages to exist has been assessed assuming ongoing commercial / industrial site use. The assessment is based on ERM's review of previous investigations, the findings of the current investigations and knowledge of the prevailing conditions at the Site.

9.2 Potential Sources of Contamination

Based on the previous investigations supplied to ERM, the known and suspected Areas of Environmental Concern (AECs), along with the Contaminants of Potential Concern (COPC) are summarised in **Table 9-1**.

Table 9.1: AECs and COPCs

Areas of Environmental Concern	Contaminants of Potential Concern
Historically imported fill (for levelling) and burial of waste materials of unknown origin and quality	Heavy metals, hydrocarbons (TRH, BTEX, PAH), asbestos
Potential firefighting activities adjacent the Site	Solvents (VOC), surfactants, PFAS
Former and existing structures – Hazardous building materials within or from on-site buildings / structures, demolition wastes	PCBs, Heavy metals, hydrocarbons (TRH, PAH), pesticides, asbestos
Former landfills located up gradient of the Site	Heavy metals, hydrocarbons (TRH, BTEX, PAH), VOCs, ammonia, PFAS, sulfate and chloride Landfill gases – methane, carbon dioxide, carbon monoxide, hydrogen sulfide
Potential historical contamination during the use of a portion of Site by Silanna Semiconductor Pty Ltd	PCBs and chlorinated hydrocarbons (CHCs)
Potential historical contamination during the occupation and operation of various industrial business activities on Site.	Heavy metals, hydrocarbons (TRH, BTEX, PAH), VOCs, CHCs, asbestos

9.3 Nature and Extent of Contamination Present

The media on Site previously identified as potentially contaminated are:

- soils (fill material and underlying natural soils);
- groundwater; and
- ground gas.

Environmental investigations have been completed by Golder-Douglas (2018), Golder-Douglas (May 2021) and Golder-Douglas (June 2021) and ERM (2022) which have informed the following summary. Sample locations are shown on Figures 2, and Figure 3.

Data collected by ERM is presented in the analytical tables Table T1 to Table T3, and data collected from others is provided in Appendix G.

The data is discussed in the following subsections.

9.3.1 Soil /Rock

Fill materials on Site have been reported to comprise gravelly sand / 'road base' gravels / crushed shale and clay / coarse and fine silty and sandy clays and clayey sands. Natural soils underlying the fill comprise clayey sands and brown/red/orange/grey silty clays, with shales observed at depth.

Metals were detected within all samples analysed at varying concentrations below the adopted human health and ecological criteria.

Total recoverable hydrocarbons, BTEX and PAHs were detected at a few locations including low level concentrations within soil samples analysed at depth from shale inside the Station Box area. All concentrations reported were below the adopted human health and ecological criteria. Two semi-volatile organic compounds (SVOCs) and one volatile organic compound VOC were reported at detectable concentrations. 2-Methylnaphthalene and 1,2,4-trimethylbenzene was reported within several soil samples analysed at depth from shale inside the Station Box area. These compounds may be indicative of naturally occurring shales or site activities. Based on the limited presence of these constituents reported within the shallower fill samples and in groundwater from on-site wells, a soil or groundwater source large enough to result in the presence of hydrocarbons in deep rock is not evident and is therefore considered unlikely to be from a contaminant source. It is therefore considered more likely these detections are natural hydrocarbons in shale rather than a site activity source.

Bis(2-ethylhexyl) phthalate (DEHP) was also detected within a shallow soil sample (BH141_0.4), located within the Construction Support area at a concentration of 8.7 mg/kg. The US EPA Regional Screening Levels (RSLs) residential soil criteria was used as a screening tool in the absence of Australian guideline values, to identify the potential contamination risk. The US EPA screening criteria for DEHP is 388 mg/kg, therefore the detected concentration of DEHP identified within BH141 is not considered to pose a human health risk.

Bonded (non-friable) asbestos containing material (ACM) was not visually observed during fieldwork and was not identified by the laboratory within the 46 samples analysed from the fill material across the Site. However, it should be noted that boreholes are recognised as not being the most effective way to detect asbestos in soils, and test pits are the preferred method to provide a more reliable assessment due to the quantity of soil that can be inspected.

Polychlorinated Biphenyls (PCBs) were not detected within the soil samples analysed.

Trace concentrations of pesticides (OCPs and OPPs) were detected at some locations within shallow soils, however all were below the adopted human health criteria.

Minor PFAS detections were reported within three samples (BH106_0.2, BH110_0.2 and BH125_0.5) collected and analysed from shallow soils / fill across the Site. All reported concentrations were below the adopted human health and ecological criteria.

9.3.2 Groundwater

Based on the off-site groundwater well data collected in January/early February 2022, the SWL was measured to be approximately 14.45 – 16.86 m BGL in the west/north of the Site and 9.29 m BGL within the well located to the east of the Site. The groundwater flow is inferred to flow north-west / west, which is different/opposite to that initially presumed (see Figure 4). The flow direction was initially presumed to flow in a general south-east direction towards the Parramatta River.

Based on the new inferred groundwater flow, the aquatic centre carpark landfill would now be located hydraulically down-gradient of the Site, with the golf driving range landfill cross gradient from the site. The Jacobs Typsa (2022) hydrogeological report also inferred groundwater flow direction is to the west/northwest.

ERM's groundwater investigation results, which comprised the sampling of five wells (two located on-site and three off-site wells), reported exceedances of adopted ecological criteria for ammonia, total phosphorous and nitrogen, arsenic, copper, iron, nickel, zinc and PFOS. Detectable concentrations of some other PFAS compounds were also reported at two of monitoring wells (SWM_BH019, located off-site to the west, and SOP-W1, located on-site). Human health screening criteria were not exceeded, however the sodium, chloride and iron concentrations exceeded aesthetic guideline values.

The available historical groundwater data also had several COPCs above ecological screening criteria but no human health screening criteria was exceeded with the exception of nickel at SWM_ENV_712s located just to the north of the station box.

It is noted that two of the monitoring wells (SMW_BH126 and AF_BH37) sampled by others (Golder Douglas) are within the Golf Driving Range (GDR) landfill. Ammonia and PFAS concentrations are high in SMW_BH126 relative to the other locations, and methane is high in these locations relative to other locations. It is noted that SWM_BH019 also has dissolved methane detected despite being 300m north of the nearest landfill location (Aquatic Centre Carpark (ACC) Landfill). ERM's groundwater results from 2022 reported dissolved methane at the laboratory LOR (0.01 mg/L) for SWM_BH019 and below LOR for onsite well SOP_W1 (<0.01 mg/L).

The groundwater results and exceedances of the adopted screening criteria are summarised within Table T4 within the 'Tables' section of this report. Historical data is presented in **Appendix G**.

9.3.3 Ground Gases

The maximum readings identified during the field screening of the on-site ground gas wells are as follows:

- Carbon dioxide readings were highest within monitoring well BH105, which recorded a maximum stabilised and peak concentration of 12.8% v/v;
- Methane readings were recorded at 0.1% v/v (which is the same as the ambient air readings) within all monitoring wells;
- Carbon monoxide (CO) and hydrogen sulfide (H_2S) were not detected across the monitoring wells onsite; and
- Flow rates recorded were very low, recording a flow rate of 0.3 L/hr within all boreholes.

The GSV and CS calculated for the Site based on three rounds of HGG monitoring undertaken at the Site is a *"very low risk"* and Situation 1 (CS1).

9.4 Potential Receptors

The potential sensitive receptors for contaminants present at the Site include:

- Present (Central Tunnelling Package and future Sydney Metro construction workforce) and future construction workers (Construction Support Area following completion of the Metro station) on the Site who may potentially be exposed to CoPCs through direct contact with impacted soils and groundwater, and/or inhalation of dusts associated with impacted soils;
- Future workers and customers on the finished Sydney Metro West line;
- General public / passers-by during construction works (dust and odour, potential direct contact with soil via trucks transporting waste spoil if sheeting/wheel washing inadequate);
- Future intrusive maintenance workers working in or around the Sydney Metro West station;

- Future users of the areas of the Site that will be developed for use subsequent to Sydney Metro's use of the land as a construction compound;
- Terrestrial ecological receptors on site;
- Aquatic ecological receptors at receiving water bodies; and
- Workforce associated with treatment plant, groundwater movement, or long term via operational tunnel/station groundwater drainage and discharge).

9.4 Potential Exposure Pathways

The following potential pathways of exposure that may result from impact to soil, groundwater or air are likely relevant to the Site Area:

- Direct contact exposure to humans or ecological receptors (soil and groundwater);
- Discharge of groundwater to surface water (Parramatta River);
- Inhalation of contaminated dust or asbestos fibres;
- Inhalation of vapours from soil or groundwater;
- Leaching of liquid and soluble contaminants to groundwater;
- Asphyxiation from accumulation of landfill gases in enclosed areas;
- Explosive risk from accumulation of methane derived from landfill gas in enclosed areas;
- Transport of dissolved / suspended contaminants in surface run-off; and
- Migration of contaminants dissolved in groundwater (including flow induced by construction dewatering).

9.5 Contamination Migration Potential

The construction works have potential to affect the distribution of contamination, particularly due to dewatering of the Station Box which is likely to result in groundwater flow moving towards the Station Box. Water pumped from the Station Box during construction will be directed to a water treatment plant and discharged into a stormwater drain that flows towards Powells Creek which drains to the Parramatta River. The tunnel construction methodology is understood to result in relatively limited groundwater drainage, and the tunnel will be constructed as a tanked structure to minimise impacts on groundwater during operation. The Station Box dewatering is therefore considered to be the most significant mechanism for creating potential migration of contaminated groundwater.

Further, disturbance created by excavation works could create dust, and/or mobilise soil vapours. These potential migration pathways are discussed within the following subsections.

9.5.1 Migration via Dewatering

Dewatering will alter the hydrogeological condition at the site, and result in a groundwater 'sink' whereby groundwater will flow towards the site from the surrounding area.

An update of the groundwater modelling originally conducted during the preparation of the EIS was included in the Jacobs Typsa (2022) Hydrogeological Assessment Report. The potential for groundwater from nearby landfills to be drawn towards the station excavation was found to be possible between 3 years and 20 years post excavation, however it was considered unlikely that contaminated groundwater would migrate to the station given the nearby landfills were designed with liners and include leachate management systems. Despite this, groundwater from off-site locations were screened against the human health and ecological criteria in order to establish whether risks to future receptors were likely.

While considered unlikely, the potential for migration of impacted groundwater from the nearby landfills (leachate) cannot be ruled out. As such, appropriate monitoring of groundwater will be required, with management actions to be implemented should groundwater conditions indicate potential risk to human health.

9.5.2 Migration of Hazardous Ground Gases via Degasification and Advection/ Diffusion in Unsaturated Zone

The only HGG identified on-site at concentrations above ambient air readings was carbon dioxide at a maximum stabilised concentration of 12.8% v/v. The final calculated GSV and CS was *"very low risk"*. Further, it is noted that the recorded values were consistent with the typical concentration range for oxidation of organic matter in soil. Therefore, based on the above and the lack of methane detected, the carbon dioxide is not considered to be associated with landfill gas migration from nearby landfills.

Dissolved methane was reported within several off-site groundwater wells sampled historically, including elevated methane levels within two wells located within the GDR landfill (which is an expected result). While no screening level was available for dissolved methane, Environment Agency (2021) considers a minimum partial pressure in excess of 5kPa, an equivalent dissolved-phase concentration of 1.6 mg/L, to be the lowest dissolved methane concentration which could cause concentrations at the lower explosive limit in air (5%) within a confined space when in contact with groundwater. Based on historical groundwater data, this concentration was exceeded at SWM_BH126, which is the monitoring well within the GDR landfill site and also at SWM_BH019, located to the north of the ACC landfill (both wells are over 200 m from the Site). In the most recent of ERM's 2022 groundwater monitoring rounds, dissolved methane was reported at the laboratory LOR (0.01 mg/L) for SWM_BH019 and below LOR for onsite well SOP_W1 (<0.01 mg/L). Therefore, the likelihood of migration of dissolved methane as a viable pathway for HGG onsite is considered to be low.

HGG (specifically methane) is an identified CoPC pertaining to the Site based on the presence of landfills in the surrounding area. Despite the reported low concentrations of dissolved methane within the most recent groundwater monitoring round, the risk of dissolved methane undergoing degasification and creating a risk to receptors at the Site and at the sites surrounding the station site is discussed further for completeness.

The surrounding landfills are identified as one of the potential sources of the dissolved methane in groundwater, which only occurs under specific conditions based on the volume of methane present in the vadose zone, temperature and pressure conditions, and water chemistry as methane solubility changes based on these conditions (e.g., 23 mg/L solubility at 25°C and atmospheric pressure[6]). The surrounding landfills (Bicentennial Park, aquatic centre car park and golf driving range), as advised by SOPA, incorporate gas extraction and venting systems, wetlands treatment systems and leachate management systems and are managed as per the *SOP Remediated Lands Management Plan* (version 2.2, May 2022). Therefore, the dissolution of methane is not considered the preferential pathway for methane gas within the landfills. Thus, the risk / likelihood of offsite migration of HGG from these landfills are considered very low under normal conditions.

Dewatering is proposed at the Site as discussed previously and will result in the creation of a groundwater 'sink' at the Site. Based on the Jacobs Typsa (2022) hydrogeological report, a drawdown of groundwater in the vicinity of the Site is anticipated. Further to that discussed above pertaining to dissolved methane, the lowering of the groundwater table will likely lower pressure in the unsaturated zone at the landfill sites. This further reduces the likelihood that dissolution of methane will be the preferential pathway for methane gas. It should also be noted that in the long-term, the generation of HGG at the landfills is not anticipated to increase as these are old landfills (>20 years) and based on a typical landfill life cycle these landfills are past the peak gas production stage.

[6] NSW EPA HGG (2020).

Should migration of leachate impacted groundwater occur and reach the site/ other nearby sites, the conditions for degasification of methane from groundwater, (i.e., extreme changes in temperature or pressure) are considered unlikely to occur.

Therefore,given all the lines of evidence presented above, ERM considers the likelihood of HGG migrating from groundwater to the vadose zone (both on site and at other surrounding sites) or the station box excavation to be unlikely and consequently the risk posed to human health by HGG to be low.

9.5.3 Migration via Water Treatment and Discharge

Treatment and discharge of groundwater potentially leads to a more rapid pathway for groundwater to enter the Parramatta River than currently exists via groundwater flow.

Previous data available on the existing groundwater well onsite, indicates ecological and/or human health exceedances for some metals, and ammonia. The offsite groundwater sampled during the course of this DSI investigation, and by others has exceedances of ecological criteria for some metals, ammonia, PFAS and nutrients. If the previous onsite data and current offsite groundwater data is any indication of the onsite groundwater quality, the untreated discharge could increase risk to ecological receptors he waterways.

The water treatment plant discharges will be regulated by NSW EPA under an Environmental Protection Licence, and this will provide sufficient regulation and management of potential impacts from discharges. If onsite groundwater quality is similar to that reported offsite, the migration risk can potentially be adequately managed.

9.5.4 Migration of Vapours and Odours

There was no evidence from the combined investigations for significant sources of either soil vapour or odorous materials. Therefore, the risk of creating migration of vapours or odours is considered low.

9.5.5 Mobilisation of Soil Contaminants

Based on the analytical results of this DSI investigation, the risk from soil contaminants is considered to be low as elevated soil contaminants were not identified across the Site.

Additionally, the majority of the Site soils are covered with hardstand, thereby preventing the aqueous mobilisation of contaminants in soils, if present. The proposed Site will also largely be covered in hardstand, post completion, thereby further preventing future mobilisation of contaminants, if present.

The minor PFAS (PFOS, PFBS and PFHxS) in soil detections were below the adopted human health and ecological criteria, is not considered likely to have potential to affect groundwater conditions.

9.6 Potentially Complete Source Pathway Receptor Linkages

A Source-Pathway-Receptor (SPR) linkage is considered to be present when a pathway links a source with a receptor. These linkages explain when there may be risks to the receptor, either now or in future.

The assessment of the SPR linkages for the soil and groundwater conditions at the Site is summarised in **Table 9-2**.

Table 9.2: SPR Linkage Assessment

Source	Pathway / Transport Mechanism	Receptor(s)	SPR linkage status
Soil	Direct Contact	Current: Sydney Metro construction workforce	Incomplete: exceedances of human health criteria were not identified during the investigation.

Source	Pathway / Transport Mechanism	Receptor(s)	SPR linkage status
	Inhalation of vapours	Future construction workers (Construction Support area following completion of the Metro station) General public / passers-by (dust only) Future users of development land outside the Sydney Metro land. Future users of Sydney Metro Station	Incomplete for Sydney Metro station use: no volatile soil contaminant sources were identified during the investigation.
	Inhalation of dust		Incomplete: exceedances of human health criteria were not identified during the investigation. Additionally, bonded (non-friable) ACM was not visually observed, and asbestos was not identified at a laboratory level.
	Exposure to flammable material		Incomplete: All TRH Management Limits were found to be compliant with the screening criteria.
	Direct Contact /Ingestion	Terrestrial ecological organisms	Incomplete: exceedances of ecological criteria were not identified during the investigation.
Groundwater	Direct Contact /Ingestion	Current: Sydney Metro construction workforce Future construction workers (Construction Support area following completion of the Metro station) Future users of the Sydney metro station and development land. Recreational users of the Parramatta River	**Potentially complete** (current and future construction workers): Based on data collected by Golder Douglas (2018, 2021), groundwater was not present at concentrations exceeding human health criteria with the exception of nickel at concentrations above recreational criteria at SWM_ENV_712S. Incomplete (future site users): Future users of either the Sydney Metro station or the development land are not considered potentially exposed to impacted groundwater because there will be no pathway for direct contact. **Potentially complete** (recreational users of the Parramatta River): Groundwater concentrations were generally below recreational criteria. Nickel at one monitoring well (SWM_ENV712S), located just off-site exceeded the recreational guideline value, however treatment of waters is proposed prior to discharge to the receiving waters, and will be regulated under an Environmental Protection Licence (EPL).
	asphyxiation / explosion		See hazardous ground gas section below.
	Inhalation of vapours		Incomplete: historical and offsite contaminant data does not indicate vapour in groundwater will present a risk under current or potential future scenarios.
	Direct Contact /Ingestion	Aquatic ecological organisms in Parramatta River	**Potentially complete** (aquatic organisms): Historical and offsite groundwater samples exceeded the ecological screening criteria (for metals, nutrients and ammonia).

Source	Pathway / Transport Mechanism	Receptor(s)	SPR linkage status
		Terrestrial flora/fauna on Site	Incomplete (terrestrial ecology): not likely to be groundwater dependent
Hazardous Ground Gas	Inhalation / asphyxiation / explosion	Current: Sydney Metro construction workforce Future users of the Sydney metro station. Future construction workers and users of the Construction Support Area following completion of the Metro station Off-site human and ecological receptors	Incomplete (current users of the site) The calculated GSV for the site is *"very low risk"* and a Situation 1. **Potentially complete** (future construction workers and users of the Site/ surrounding sites): The dewatering during Sydney Metro station construction will result in the movement of groundwater from beneath nearby landfill sites toward the station. While considered unlikely given the landfills are lined and leachate is managed, there is the potential that if hazardous ground gasses are in groundwater and if these hazardous ground gasses de-gas from the groundwater, they could present a human health risk to future workers and users of the site/surrounding sites under this scenario. While this future SPR linkage is unlikely to be complete, the 'potentially complete' category has been assigned as future data will be necessary to categorically rule this out. It is noted that a change in the groundwater levels as modelled is not likely to affect the operation of containment system within the nearby landfill sites.

In summary the potentially viable SPR linkages that require remediation action (further assessment, remediation or management) comprise:

- Potential risk to Sydney Metro current and future construction workers and users via direct contact with groundwater.
- Potential risk to recreational users of Parramatta River via direct contact/ingestion of groundwater to surface water in the Parramatta River.
- Potential risks to aquatic organisms in Parramatta River and its tributaries from discharge of impacted groundwater.
- Potential risks associated with hazardous ground gas in groundwater to future construction workers and users of the Site.

10. DISCUSSION

A brief discussion of the decision rules set out within **Section 5.1.5** to achieve the DSI objective is provided within **Table 10-1** below.

Table 10.1: Assessment of Decision Objectives

Decision No.	Decision	Decision Rules
1	Is there sufficient information on the distribution and characteristics of contaminated soil, groundwater and ground gas across the site to evaluate risk of harm to human health or the environment and whether off-site migration of contamination may have occurred?	Soil sampling has been undertaken in accordance with the minimum sampling densities specified within NSW EPA (1995). Soil sample results have been compared to the relevant health-based and ecological criteria for in-situ soils. As such, it is considered sufficient characterisation of the soil has been undertaken. While some on-site wells were inaccessible during the DSI, the onsite and off-site groundwater data ERM was able to collect was supplemented with historical onsite and offsite groundwater data. The data available is considered sufficient to evaluate risk of harm to human health and ecological receptors. Additional offsite groundwater wells to act as sentinel wells to enable the monitoring of changing groundwater conditions were unable to be installed during this DSI due to previously discussed time/permitting constraints, however, installation of these wells to supplement the wider monitoring well network was underway at the time of writing. Based on the three rounds of data collected for HGG, the data available is considered sufficient to inform the risk characterisation of the HGG present onsite. Potential future HGG risks were unable to be directly assessed with the available data, although consideration of the likelihood for the presence of HGG in groundwater given landfill design and leachate management indicate this is unlikely, as is the likelihood of HGG de-gassing from groundwater and presenting a plausible risk to human health.
2	Is there sufficient information collected for the accurate in-situ waste classification for material within the Station Box footprint?	The number of samples required to satisfy the minimum sampling density for in-situ waste classification purposes for the fill is 25 samples. ERM has collected and analysed 22 samples and required TCLP for samples that have exceeded the waste criteria, have been undertaken. The number of samples required were calculated based on a linear average calculation undertaken to determine the average fill depth across the Station Box. ERM notes that the central portion of the Station Box was observed to comprise significantly less fill in comparison with the rest of the Station Box. As such, ERM was unable to collect additional fill samples within this central portion. Therefore, with consideration to the conservative volume calculation based on the linear average depth, ERM considers an adequate number of samples have been collected and analysed for accurate in-situ waste classification. Twenty samples were collected and analysed of the natural material across the Station Box Area, and is considered representative of the natural material. As such, it is considered that sufficient data was collected for the accurate in-situ waste classification of the material within the Station Box. Waste classification reports have been appended to the report as Appendix H. It should be noted that detectable concentrations of hydrocarbons (TRH, PAHs, SVOCs) were identified within the natural soils at depth, and may affect the classification of natural material as VENM. The compounds

Decision No.	Decision	Decision Rules
		identified may be indicative of naturally occurring shales, and the possibility of this should be further discussed as part of the in-situ waste classification.
3	Are there any potential unacceptable risks to human health and/or ecological receptors from fill/soil, groundwater and/ or ground gas?	Exceedances of human health or ecological criteria were not identified within the soil samples analysed during this DSI investigation. Exceedances of human health and ecological criteria were identified within the historical onsite groundwater sample analysed (GDP, 2018). Elevated concentrations of carbon dioxide were identified during the landfill gas field screening. However, the calculated GSV for the proposed works based on the end land use is *"very low risk"* and a Situation 1, which only includes the current construction workers and the end users of the Sydney metro station area.
4	Is there any evidence of, or potential for, migration of contaminants from the site?	Elevated concentrations of metals have been reported within onsite and offsite groundwater samples. However, it is difficult to discern if contaminants have migrated onto Site from potential offsite sources and/or if the Site may be contributing to these concentrations and/or if it is representative of background groundwater conditions of Homebush Bay.
5	Is management or remediation of contamination, if identified, potentially required?	For the Sydney Metro station site including the Station Box and surface access areas there are considered to be no risks to current or future site users or workforce from soil. Based on the outcomes of this assessment, the groundwater may pose a risk to Site users and the environment. Management preventing direct contact with groundwater will be required, treatment of water entering the station box will be required prior to discharge at a surface water body (as is planned) and ongoing monitoring under an updated version of the Groundwater Management Plan (GWMP) will be required to monitor potential changes in groundwater conditions during / following dewatering. While considered unlikely, there is the potential for hazardous ground gas to be transported via groundwater to the station. Monitoring and management of this potential scenario is recommended. Details of the monitoring and management are proposed to be included within an updated version of the GWMP.
6	Is there sufficient information on the distribution and characteristics of contaminated soil, groundwater and ground gas across the site to develop a Remedial Action Plan or Environmental Management Plan to (where necessary) remediate and/or manage site contamination?	A remedial action plan or environmental management plan is considered not required for the Site in terms of soil, groundwater and ground gas risks (however a RAP may be required for spoil management purposes). Groundwater monitoring and management should be undertaken to ensure hazardous ground gas in groundwater does not pose a risk to future users of the station. A wider monitoring program is already proposed and outlined in a Groundwater Management Plan (GWMP). It is proposed that additional monitoring and management requirements can be incorporated into this plan instead of a RAP.

Based on the above discussion and information outlined within this DSI, ERM considers that the Site is suitable for general industrial and the Sydney Metro station use, subject to the following:

- An Unexpected Finds Protocol (UFP) should be prepared as part of the Construction Environmental Management Plan (CEMP) to be implemented during the construction works, to outline the safe

and appropriate actions to be undertaken in the event of encountering potential contamination that may arise from unexpected sources, including asbestos in soils during the construction works.

- Requirements for the monitoring and management of groundwater and ground gas in the vicinity of the Sydney Olympic Park site is to be documented in an updated version of the GWMP and implemented accordingly.
- Appropriate measures are specified within the Soil and Groundwater Management Plan, and any relevant occupational health and safety procedures to prevent direct contact with groundwater during construction and operation of the Station.

11. COMPLIANCE WITH THE DEED AND COA

Table 11.1: Assessment of Compliance

Clause [a]	Requirement [b]	Compliance [c]
Deed Requirements		
12.19 (a)	Except for Preliminary Works, the Tunnelling Contractor must perform and submit to the Principal's Representative and the Independent Certifier a Detailed Site Investigation prior to commencing any excavation activities	This DSI has been submitted to and reviewed by Principal's Representative and the Independent Certifier.
(i)	at any Area of Contamination Concern; and	The Areas of Contamination Concern are described and addressed by the scope of the DSI.
(ii)	to the extent otherwise required under the Planning Approvals	No additional requirement: see comment under CoA D71
12.19 (b)	Notwithstanding clause 12.19(a), the Tunnelling Contractor may also perform additional Detailed Site Investigations carried out in other areas of the Construction Site or outside the Construction Site if the Tunnelling Contractor deems it necessary to manage the risks associated with contaminated land and to appropriately plan for Remediation. Any additional Detailed Site Investigation performed in accordance with this clause 12.19(b) must also be submitted to the Principal's Representative and the Independent Certifier.	There is currently no additional DSI planned
12.19 (c)	Each Detailed Site Investigation	
(i)	must	
A	investigate areas of proposed excavation or disturbance	The whole footprint of SOP Construction Site is covered by the DSI, and therefore all areas of potential excavation or disturbance have been adequately investigated. The planned disturbance/excavation areas are shown in Figure 1
B	investigate land within the Construction Site or Extra Land surrounding the areas of proposed excavation or disturbance with respect to the potential migration of Contamination via groundwater, ground gas, vapour and odour into the areas of excavation or disturbance; and	The land within SOP Construction Site has been adequately investigated with respect to potential migration via groundwater, ground gas, vapour (no significant volatile substances detected, and not considered likely) and odours (no significantly odorous material encountered).
C	characterise risks to the construction, operation and maintenance of Sydney Metro West and its infrastructure from Contamination	Risks are characterised in Section 9, Conceptual Site Model.
(ii)	be prepared in accordance with Law, Good Industry Practice, the Planning Approvals, all guidelines made or approved by the EPA and any other requirements of this deed;	This DSI has been prepared in accordance with this requirement.

Clause [a]	Requirement [b]	Compliance [c]
(iii)	be reviewed and approved by a Certified Contaminated Land Consultant; and	This DSI has been reviewed and approved by a Certified Contaminated Land Consultant (Peter Lavelle, CEnvP SC).
(iv)	characterise the risk of Contamination migrating from the Construction Site as a result of the Tunnelling Contractor's Activities;	See Section 9 Conceptual Site Model.
12.19(d)	In addition to the requirements set out in clause 12.19(c), each Detailed Site Investigation performed within an Area of Contamination Concern must:	
(i)	To be reviewed and endorsed by an Accredited Site Auditor; and	This report is scheduled to be reviewed and endorsed by NSW accredited Site Auditor James Davis of Enviroview.
(ii)	Be accompanied by an Interim Site Audit Advice prepared by the Accredited Site Auditor when submitted to the Principal's Representative and the Independent Certifier in accordance with clause 12.19(a).	The Interim Site Audit Advice will be provided separately.
12.19 (e)	In addition to the requirements set out in clauses 12.19(c) and 12.19(d), each Detailed Site Investigation performed within a Key Contaminated Area must in accordance with the relevant EPA guidelines:	The whole Site was identified as a KCA, this report has been prepared in accordance with the relevant EPA guidelines
(i)	determine and delineate the lateral and vertical extent of Contamination within each Key Contaminated Area;	Soil criteria exceedances were not identified within this DSI. . Concentrations of constituents of potential concern in groundwater exceeding human health and /or ecological screening criteria were present within onsite and offsite wells (current and historical data). Concentrations were not attributed to a particular on-site or off-site source, but considered representative of the groundwater conditions in the Homebush Bay area. Ground gas at the site has been assessed and a "very low risk" has been assigned to the Site in terms of HGG.
(ii)	include in-situ classification of Solid Waste at sampling densities not less than that specified within the NEPM (2013) and the Industrial Waste Resources Guidelines (7), Sampling and Analysis: Soil Sampling (EPA Victoria 2010), except for Virgin Excavated Natural Material (VENM) and Excavated Natural Material (ENM) which are to be classified in accordance with the requirements of the Protection of the Environment Operations Act 1997 (NSW);	ERM considers sufficient samples have been collected and analysed for in-situ waste classification purposes. Waste classification of soils generated from the excavation of materials will not be conducted by ERM, as such this information has not been reported on within the DSI.
(iii)	classify the Solid Waste in accordance with the Waste Classification Guidelines using a statistical approach where relevant;	
(iv)	be suitably detailed so as to inform the development of the Remediation Action Plan, any Remediation Cost Estimate and any Agreed Remediation Scope and to characterise contamination risk to the construction, operation and maintenance of Sydney Metro West (including but not limited to soil, groundwater, ground gas, vapour and odour risks arising from	The RAP is proposed to be focused on spoil management and sufficient data has been obtained to enable RAP development. The DSI report has identified the presence of groundwater which require avoidance of direct contact, and

Clause [a]	Requirement [b]	Compliance [c]
	Contamination within the area of proposed excavation or disturbance or migrating into the area of proposed excavation or disturbance); and	also treatment prior to disposal to surface water environments. The DSI has also identified gas in groundwater off-site, and monitoring the groundwater surrounding the site is recommended. The DSI has sufficient information to inform the monitoring plan and measures to be incorporated to the Groundwater Monitoring Plan document.
(v)	without limiting the Tunnelling Contractor's obligations under clause 12.20A(h), characterise the risk of any PFAS contained in Solid Wastes in respect of The Bays PFAS Key Contaminated Area.	Not applicable
CoA requirements		
Condition D71	Before commencement of any construction that would result in the disturbance of moderate to high risk contaminated sites as identified in the documents identified in Condition A1 of this schedule, Detailed Site Investigations (for contamination) must be conducted to determine the full nature and extent of the contamination. The Detailed Site Investigation Report(s) and the subsequent report(s), must be prepared, or reviewed and approved, by consultants certified under either the Environment Institute of Australia and New Zealand's Certified Environmental Practitioner (Site Contamination) scheme (CEnvP(SC)) or the Soil Science Australia Certified Professional Soil Scientist Contaminated Site Assessment and Management (CPSS CSAM) scheme. The Detailed Site Investigations must be undertaken in accordance with guidelines made or approved under section 105 of Contaminated Land Management Act 1997 (NSW). The Detailed Site Investigation for Sydney Olympic Park metro construction site must be prepared in consultation with SOPA. *Note: Nothing in this condition prevents the Proponent from preparing individual Remedial Action Plans for separate sites*	The high risk areas referred to are defined by the Environmental Impact Statement for the project. There are three related to the SOP Construction Site, comprising AEI 30 (former Gold Driving Range landfill), AEI 31 (Aquatic centre landfill), AEI 32 (Bicentennial park landfill). All of which are located surrounding the Construction Site. ERM confirms that the DSI has been prepared in accordance with the specified guidance, and has been reviewed and approved by a CEnvP (SC). SOPA was provided the Draft DSI for review and the current version of this DSI includes updates to address SOPA comments.
Condition D72	Should remediation be required to make land suitable for the final intended land use, a Remedial Action Plan must be prepared, or reviewed and approved, by consultants certified under either the Environment Institute of Australia and New Zealand's Certified Environmental Practitioner (Site Contamination) scheme (CEnvP(SC)) or the Soil Science Australia Certified Professional Soil Scientist Contaminated Site Assessment and Management (CPSS CSAM) scheme. The Remedial Action Plan must be prepared in accordance with relevant guidelines made or approved by the EPA under section 105 of the Contaminated Land Management Act 1997 (NSW) and must include measures to remediate the contamination at the site to ensure the site will be suitable for the proposed use when the Remedial Action Plan is implemented. The	The RAP is proposed to be focused on spoil management. This DSI does not require remediation measures to be completed to make the land suitable for the intended site use, provided the measures in the Groundwater Management Plan are implemented.

Clause [a]	Requirement [b]	Compliance [c]
	Remedial Action Plan for Sydney Olympic Park metro construction site must be prepared in consultation with SOPA. *Note: Nothing in this condition prevents the Proponent from preparing individual Remedial Action Plans for separate sites*	
Condition D76	A copy of Detailed Site Investigation Report(s), Remedial Action Plan(s), Validation Report(s), Site Audit Report(s) and Site Audit Statement(s) must be submitted to the Planning Secretary, SOPA (in respect of Sydney Olympic Park) and the Relevant Council(s) for information.	Following the review and endorsement of this report by a NSW EPA accredited Site Auditor, it is understood that AFJV is to provide this report to SOPA and Parramatta Council for review and comment.

12. DATA GAPS

Following a review of the deed conditions and data presented within this report, ERM has identified the below data gaps and a discussion is provided pertaining to the requirement of further investigation and/or if it can be closed out and managed via management plans.

Table 12.1: Data Gap Discussion

Data Gap Identified	Discussion	Decision / Conclusion
Asbestos - sampling methods utilised for were not ideal for asbestos identification.	The SAQP initially proposed some test pits to enable greater ability to inspect soils, however challenges arose with this method and boreholes were completed instead. Agreement on the change in methodology was obtained from the site Auditor following the presentation of the initial investigation observations suggesting asbestos materials were not likely to be identified at the site. These lines of evidence included the presence of very little fill in most locations, and the fill being comprised of crushed mudstone with no anthropogenic material. Agreement on the changed approach was based on similar conditions being encountered across the remainder of the site, and test pits were to be a requirement if any evidence of fill containing anthropogenic materials was encountered, which it was not. The investigation is therefore considered to be adequate in characterising the soil, and due to the lack of evidence of asbestos material, quantification of asbestos at the site is not considered to be a data gap. Asbestos was not detected in the samples analysed within the investigation. Unexpected finds of asbestos can be managed under an UFP as discussed within **Section 10.**	Closed out with an Unexpected Finds Protocol (UFP)
Leachate and dissolved hazardous ground gas migration via groundwater from former landfills in the surrounding area.	As discussed within this DSI, leachate migration and HGG dissolution / migration is considered unlikely due to the management systems in place at the landfills. However unlikely, groundwater changes during and following dewatering is recommended to be monitored until it can conclusively be stated that adverse impacts from dewatering at the Site are not taking place.	Groundwater monitoring to be undertaken under an updated version of the existing GWMP. Monitoring to include, but not be limited to, analysis for dissolved methane, metals, ammonia, nitrate, major cations and anions.

13. CONCLUSIONS

ERM was engaged by AFJV to conduct a DSI at the SOP Construction Site. The DSI was undertaken to enable collection of sufficient environmental data to supplement previous investigation and refine the understanding of potential contamination associated with current and historical land use, to determine whether remediation is required and to provide data to facilitate waste classification of material to be removed within the Station Box.

Investigations were completed between 12 January 2022 and 22 March 2022 in general accordance with that outlined within the ERM SAQP (2022). Works completed included the progression of 45 boreholes in total, conversion of five boreholes to HGG monitoring wells and the sampling of five offsite groundwater wells.

Overall based on the findings of the previous assessments, desktop investigation undertaken, the findings of this DSI and the refined CSM, and subject to the objectives and limitations of this report, the following is concluded:

- Soil sampling has been undertaken in accordance with the minimum sampling densities specified within NSW EPA (1995) and the required sampling density for in-situ waste classification is considered met. Soil sample results have been compared to the relevant health-based and ecological criteria for in-situ soils. As such, it is considered sufficient characterisation of the soil has been undertaken and a risk posed to receptors from soil has not been identified. It should however be noted that boreholes are recognised as not being the most effective way to detect asbestos in soils. Therefore, an unexpected finds protocol is recommended to mitigate risks associated with potential unexpected finds.
- On-site and off-site groundwater data indicate COPCs are generally below human health screening criteria with the exception of nickel in groundwater just beyond the northern site boundary. Direct contact with groundwater should therefore be avoided.
- On-site and off-site groundwater data also indicate COPCs exceed ecological criteria, and so treatment of the water is necessary prior to discharge to a surface water body, as planned, and to be regulated under an EPL.
- Methane in groundwater is not present at concentrations that could produce hazardous conditions at the site. While dissolved methane is in groundwater off-site, and dewatering will result in groundwater from off-site migrating to the station box, it is considered unlikely that groundwater containing dissolved methane concentrations that could produce hazardous conditions will occur at the station box. Monitoring and management of groundwater will be required to ensure risks to site users from dissolved gases in groundwater remains absent. Monitoring and management requirements are proposed to be included in the Groundwater Management Plan.
- Hazardous Ground Gas (HGG) monitoring identified elevated concentrations of carbon dioxide, however, the calculated GSV was calculated to be *"very low risk"* and a Situation 1.

Based on the information outlined within this DSI, ERM considers that the Site is suitable for the Sydney Metro station use, subject to the following:

- An Unexpected Finds Protocol (UFP) should be prepared as part of the Construction Environmental Management Plan (CEMP) to be implemented during the construction works, to outline the safe and appropriate actions to be undertaken in the event of encountering potential contamination that may arise from unexpected sources, including asbestos in soils during the construction works.
- Requirements for the monitoring and management of groundwater and ground gas in the vicinity of the Sydney Olympic Park site is to be documented in an updated version of the Groundwater Management Plan (GWMP) and implemented accordingly.
- Appropriate measures are specified within the Soil and Groundwater Management Plan, and any relevant occupational health and safety procedures to prevent direct contact with groundwater during construction and operation of the Station.

As remediation is not required, a Remediation Action Plan (RAP) is not considered necessary for the purposes of rendering the site suitable for use, but is required to meet the Sydney Metro West – Central Tunnelling Works Design and Construction Deed requirements of the AFJV Contract with Sydney Metro.

The document will be prepared in a manner consistent with a standard RAP and as such will document all necessary actions to be undertaken at the Site in order to appropriately manage excavated soils and in a manner posing no unacceptable risk to human health or the environment.

ERM considers that the applicable requirements of the Deed and the project CoA have been complied with.

APPENDIX A LOTSEARCH REPORT

LOTSEARCH

LOTSEARCH ENVIRO PROFESSIONAL

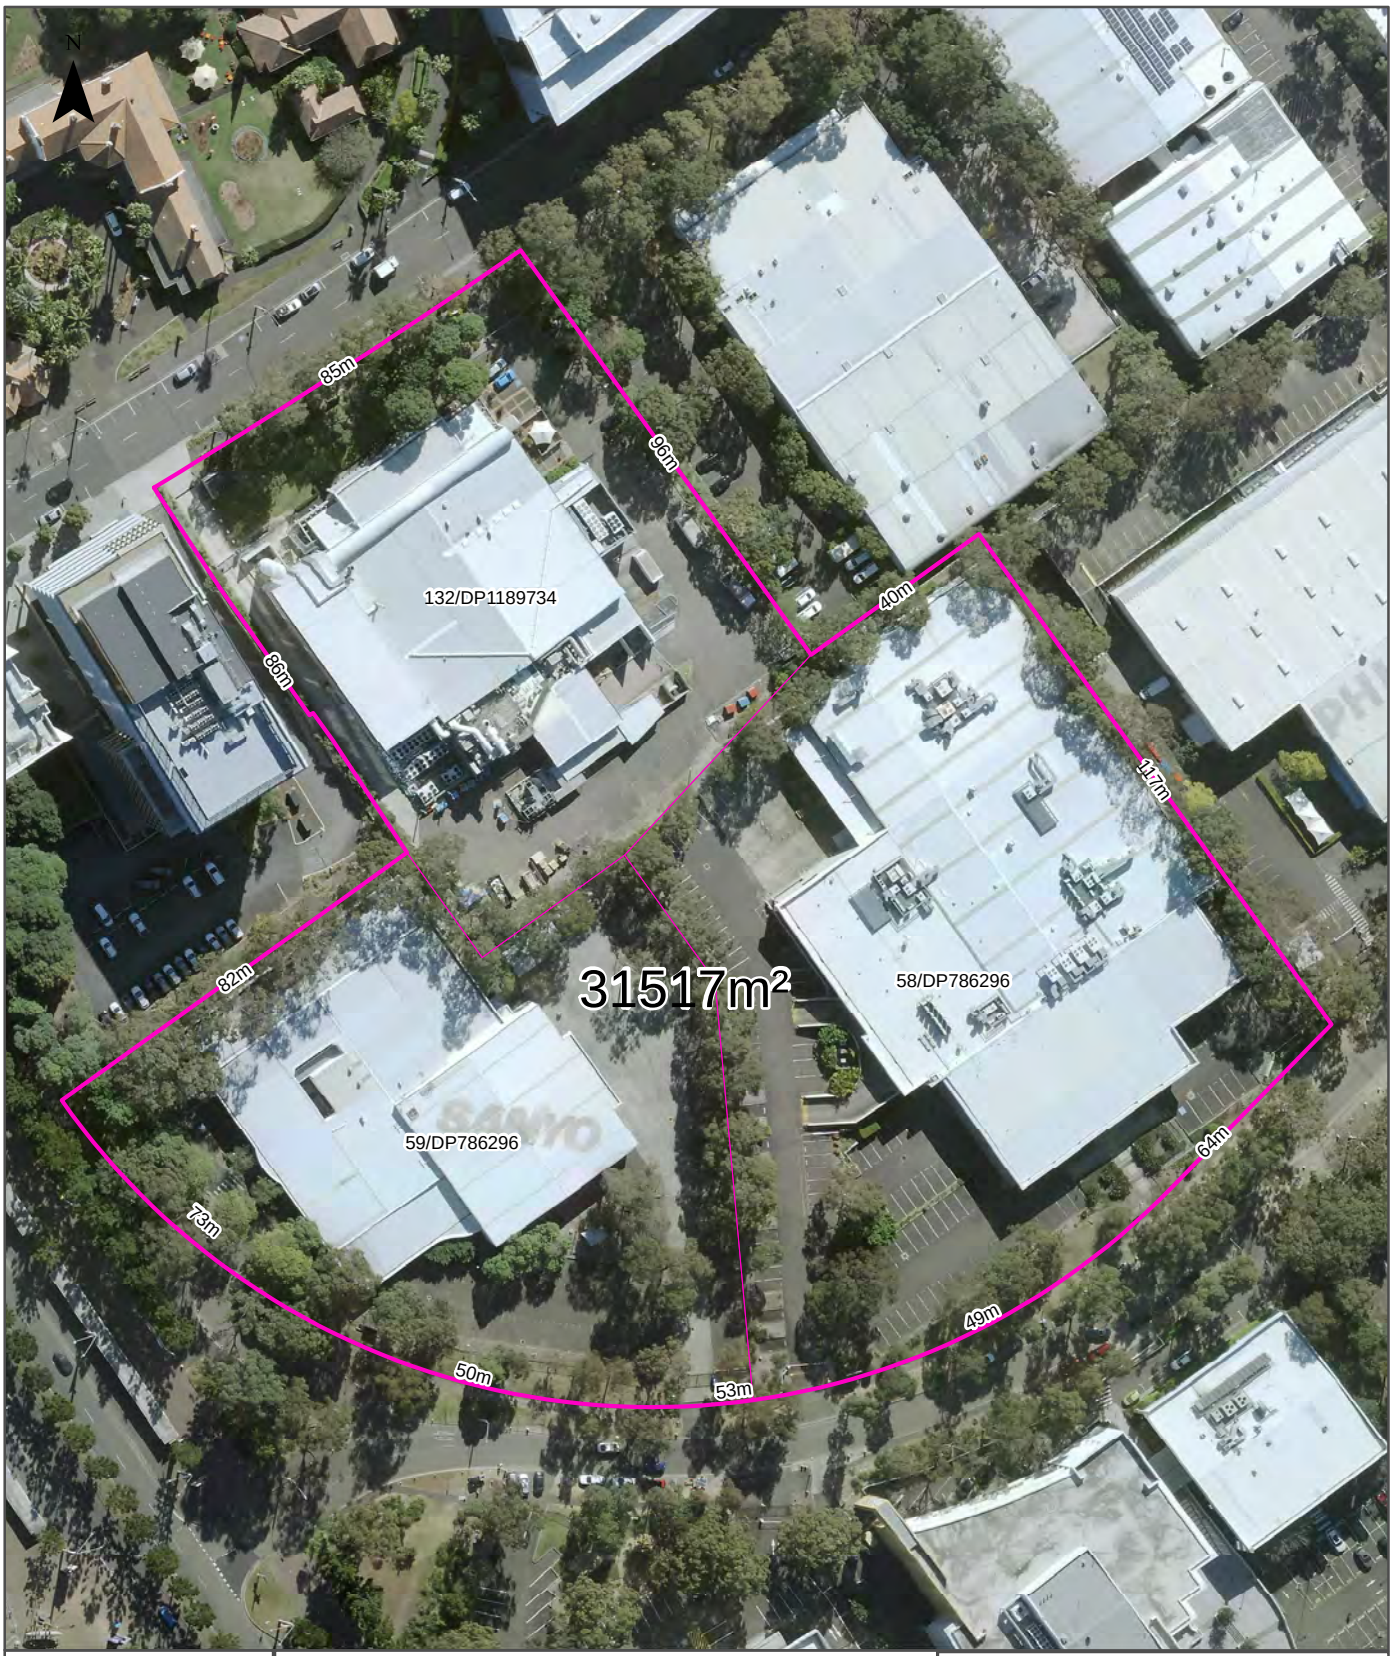
Date: 03 Feb 2022 15:56:54

Reference: LS028900 EP

Address: 7 Figtree Drive, Sydney Olympic Park, NSW 2127

Disclaimer:
The purpose of this report is to provide an overview of some of the site history, environmental risk and planning information available, affecting an individual address or geographical area in which the property is located. It is not a substitute for an on-site inspection or review of other available reports and records. It is not intended to be, and should not be taken to be, a rating or assessment of the desirability or market value of the property or its features.
You should obtain independent advice before you make any decision based on the information within the report.
The detailed terms applicable to use of this report are set out at the end of this report.

Dataset Listing



Datasets contained within this report, detailing their source and data currency:

Dataset Name	Custodian	Supply Date	Currency Date	Update Frequency	Dataset Buffer (m)	No. Features On-site	No. Features within 100m	No. Features within Buffer

List of NSW contaminated sites notified to EPA

Records from the NSW EPA Contaminated Land list within the dataset buffer:

Map Id	Site	Address	Suburb	Activity	Management Class	Status	Location Confidence	Dist	Direction
1263	Aquatic Centre Carpark Landfill	Shane Gould Avenue	SYDNEY OLYMPIC PARK	Landfill	Ongoing maintenance required to manage residual contamination (CLM Act)	Current EPA List	Premise Match	139m	South West
1266	Former Golf Driving Range Landfill	Sarah Durack Avenue	SYDNEY OLYMPIC PARK	Landfill	Ongoing maintenance required to manage residual contamination (CLM Act)	Current EPA List	Premise Match	149m	South East
1264	Bicentennial Park	Bicentennial Drive	SYDNEY OLYMPIC PARK	Landfill	Ongoing maintenance required to manage residual contamination (CLM Act)	Current EPA List	Premise Match	301m	East
623	Ausgrid Mason Park Substation	1 Underwood Road	Homebush	Other Industry	Regulation under CLM Act not required	Current EPA List	Premise Match	711m	South East
1265	Kronos Hill Landfill	Kevin Coombes AVENUE	SYDNEY OLYMPIC PARK	Landfill	Ongoing maintenance required to manage residual contamination (CLM Act)	Current EPA List	Premise Match	867m	North West
624	SUEZ Waste Recycling Centre (WRC) and Cleanaway Liquid Waste Treatment Plant (LWTP)	Corner Pondage Link and Hill Road	Homebush Bay	Landfill	Regulation under CLM Act not required	Current EPA List	Premise Match	871m	North West
622	Caltex Service Station Homebush West	334-336 Parramatta Road	Homebush West	Service Station	Regulation under CLM Act not required	Current EPA List	Premise Match	893m	South
1267	Haslams Creek South Area 3	At Kronos Hill, Kevin Coombes Avenue	SYDNEY OLYMPIC PARK	Landfill	Contamination formerly regulated under the CLM Act	Current EPA List	Premise Match	901m	North West

The values within the EPA site management class in the table above, are given more detailed explanations in the table below:

EPA site management class	Explanation
Contamination being managed via the planning process (EP&A Act)	The EPA has completed an assessment of the contamination and decided that the contamination is significant enough to warrant regulation. The contamination of this site is managed by the consent authority under the Environmental Planning and Assessment Act 1979 (EP&A Act) planning approval process, with EPA involvement as necessary to ensure significant contamination is adequately addressed. The consent authority is typically a local council or the Department of Planning and Environment.

EPA site management class	Explanation
Contamination currently regulated under CLM Act	The EPA has completed an assessment of the contamination and decided that the contamination is significant enough to warrant regulation under the Contaminated Land Management Act 1997 (CLM Act). Management of the contamination is regulated by the EPA under the CLM Act. Regulatory notices are available on the EPA's Contaminated Land Public Record of Notices.
Contamination currently regulated under POEO Act	The EPA has completed an assessment of the contamination and decided that the contamination is significant enough to warrant regulation. Management of the contamination is regulated under the Protection of the Environment Operations Act 1997 (POEO Act). The EPA's regulatory actions under the POEO Act are available on the POEO public register.
Contamination formerly regulated under the CLM Act	The EPA has determined that the contamination is no longer significant enough to warrant regulation under the Contaminated Land Management Act 1997 (CLM Act). The contamination was addressed under the CLM Act.
Contamination formerly regulated under the POEO Act	The EPA has determined that the contamination is no longer significant enough to warrant regulation. The contamination was addressed under the Protection of the Environment Operations Act 1997 (POEO Act).
Contamination was addressed via the planning process (EP&A Act)	The EPA has determined that the contamination is no longer significant enough to warrant regulation. The contamination was addressed by the appropriate consent authority via the planning process under the Environmental Planning and Assessment Act 1979 (EP&A Act).
Ongoing maintenance required to manage residual contamination (CLM Act)	The EPA has determined that ongoing maintenance, under the Contaminated Land Management Act 1997 (CLM Act), is required to manage the residual contamination. Regulatory notices under the CLM Act are available on the EPA's Contaminated Land Public Record of Notices.
Regulation being finalised	The EPA has completed an assessment of the contamination and decided that the contamination is significant enough to warrant regulation under the Contaminated Land Management Act 1997. A regulatory approach is being finalised.
Regulation under the CLM Act not required	The EPA has completed an assessment of the contamination and decided that regulation under the Contaminated Land Management Act 1997 is not required.
Under assessment	The contamination is being assessed by the EPA to determine whether regulation is required. The EPA may require further information to complete the assessment. For example, the completion of management actions regulated under the planning process or Protection of the Environment Operations Act 1997. Alternatively, the EPA may require information via a notice issued under s77 of the Contaminated Land Management Act 1997 or issue a Preliminary Investigation Order.

Business Directory Records 1950-1991
Road or Area Matches

Universal Business Directory records from years 1991, 1986, 1982, 1978, 1975, 1970, 1965, 1961 & 1950, mapped to a road or an area, within the dataset buffer. Records are mapped to the road when a building number is not supplied, cannot be found, or the road has been renumbered since the directory was published:

Atlas of Australian Soils

7 Figtree Drive, Sydney Olympic Park, NSW 2127

Soils

7 Figtree Drive, Sydney Olympic Park, NSW 2127

Atlas of Australian Soils

Soil mapping units and Australian Soil Classification orders within the dataset buffer:

Map Unit Code	Soil Order	Map Unit Description	Distance	Direction
Tb36	Sodosol	Undulating: chief soils are hard acidic yellow mottled soils (Dy3.41) usually containing some ironstone gravels throughout the profile. Associated are small areas of units Pb12 and Pb13.	0m	On-site
Pb12	Kurosol	Gently rolling to rounded hilly country with some steep slopes and broad valleys: chief soils are hard acidic red soils (Dr2.21) with hard neutral and acidic yellow mottled soils (Dy3.42 and Dy3.41) on lower slopes and in valleys. Associated are small areas of various soils including (Gn3.54) on some ridges, (Dr3.31) on some slopes; (Dr2.23) in saddles and some mid-slope positions, and some low- lying swampy areas of (Uf6) soils and (Uc1.2) soils with peaty surfaces. Small areas of other soils such as (Db1.2) are likely throughout.	730m	East

Location Confidences

Where Lotsearch has had to georeference features from supplied addresses, a location confidence has been assigned to the data record. This indicates a confidence to the positional accuracy of the feature. Where applicable, a code is given under the field heading “LC” or “LocConf”. These codes lookup to the following location confidences:

LC Code	Location Confidence
Premise Match	Georeferenced to the site location / premise or part of site
Area Match	Georeferenced to an approximate or general area
Road Match	Georeferenced to a road or rail corridor
Road Intersection	Georeferenced to a road intersection
Buffered Point	A point feature buffered to x metres
Adjacent Match	Land adjacent to a georeferenced feature
Network of Features	Georeferenced to a network of features
Suburb Match	Georeferenced to a suburb boundary
As Supplied	Spatial data supplied by provider

USE OF REPORT - APPLICABLE TERMS

The following terms apply to any person (End User) who is given the Report by the person who purchased the Report from Lotsearch Pty Ltd (ABN: 89 600 168 018) (Lotsearch) or who otherwise has access to the Report (Terms). The contract terms that apply between Lotsearch and the purchaser of the Report are specified in the order form pursuant to which the Report was ordered and the terms set out below are of no effect as between Lotsearch and the purchaser of the Report.

1. End User acknowledges and agrees that:
   (a) the Report is compiled from or using content (**Third Party Content**) which is comprised of:
      (i) content provided to Lotsearch by third party content suppliers with whom Lotsearch has contractual arrangements or content which is freely available or methodologies licensed to Lotsearch by third parties with whom Lotsearch has contractual arrangements (**Third Party Content Suppliers**); and
      (ii) content which is derived from content described in paragraph (i);
   (b) Neither Lotsearch nor Third Party Content Suppliers takes any responsibility for or give any warranty in relation to the accuracy or completeness of any Third Party Content included in the Report including any contaminated land assessment or other assessment included as part of a Report;
   (c) the Third Party Content Suppliers do not constitute an exhaustive set of all repositories or sources of information available in relation to the property which is the subject of the Report (**Property**) and accordingly neither Lotsearch nor Third Party Content Suppliers gives any warranty in relation to the accuracy or completeness of the Third Party Content incorporated into the report including any contaminated land assessment or other assessment included as part of a Report;
   (d) Reports are generated at a point in time (as specified by the date/time stamp appearing on the Report) and accordingly the Report is based on the information available at that point in time and Lotsearch is not obliged to undertake any additional reporting to take into consideration any information that may become available between the point in time specified by the date/time stamp and the date on which the Report was provided by Lotsearch to the purchaser of the Report;
   (e) Reports must be used or reproduced in their entirety and End User must not reproduce or make available to other persons only parts of the Report;
   (f) Lotsearch has not undertaken any physical inspection of the property;
   (g) neither Lotsearch nor Third Party Content Suppliers warrants that all land uses or features whether past or current are identified in the Report;
   (h) the Report does not include any information relating to the actual state or condition of the Property;
   (i) the Report should not be used or taken to indicate or exclude actual fitness or unfitness of Land or Property for any particular purpose
   (j) the Report should not be relied upon for determining saleability or value or making any other decisions in relation to the Property and in particular should not be taken to be a rating or assessment of the desirability or market value of the property or its features; and
   (k) the End User should undertake its own inspections of the Land or Property to satisfy itself that there are no defects or failures
2. The End User may not make the Report or any copies or extracts of the report or any part of it available to any other person. If End User wishes to provide the Report to any other person or make extracts or copies of the Report, it must contact the purchaser of the Report before doing so to ensure the proposed use is consistent with the contract terms between Lotsearch and the purchaser.
3. Neither Lotsearch (nor any of its officers, employees or agents) nor any of its Third Party Content Suppliers will have any liability to End User or any person to whom End User provides the Report and End User must not represent that Lotsearch or any of its Third Party Content Suppliers accepts liability to any such person or make any other representation to any such person on behalf of Lotsearch or any Third Party Content Supplier.
4. The End User hereby to the maximum extent permitted by law:
   (a) acknowledges that the Lotsearch (nor any of its officers, employees or agents), nor any of its Third Party Content Supplier have any liability to it under or in connection with the

Report or these Terms;

(b) waives any right it may have to claim against Third Party Content Supplier in connection with the Report, or the negotiation of, entry into, performance of, or termination of these Terms; and

(c) releases each Third Party Content Supplier from any claim it may have otherwise had in connection with the Report, or the negotiation of, entry into, performance of, or termination of these Terms.

5. The End User acknowledges that any Third Party Supplier shall be entitled to plead the benefits conferred on it under clause 4, despite not being a party to these terms.
6. End User must not remove any copyright notices, trade marks, digital rights management information, other embedded information, disclaimers or limitations from the Report or authorise any person to do so.
7. End User acknowledges and agrees that Lotsearch and Third Party Content Suppliers retain ownership of all copyright, patent, design right (registered or unregistered), trade marks (registered or unregistered), database right or other data right, moral right or know how or any other intellectual property right in any Report or any other item, information or data included in or provided as part of a Report.
8. To the extent permitted by law and subject to paragraph 9, all implied terms, representations and warranties whether statutory or otherwise relating to the subject matter of these Terms other than as expressly set out in these Terms are excluded.
9. Subject to paragraph 6, Lotsearch excludes liability to End User for loss or damage of any kind, however caused, due to Lotsearch's negligence, breach of contract, breach of any law, in equity, under indemnities or otherwise, arising out of all acts, omissions and events whenever occurring.
10. Lotsearch acknowledges that if, under applicable State, Territory or Commonwealth law, End User is a consumer certain rights may be conferred on End User which cannot be excluded, restricted or modified. If so, and if that law applies to Lotsearch, then, Lotsearch's liability is limited to the greater of an amount equal to the cost of resupplying the Report and the maximum extent permitted under applicable laws.
11. Subject to paragraph 9, neither Lotsearch nor the End User is liable to the other for:
    (a) any indirect, incidental, consequential, special or exemplary damages arising out of or in relation to the Report or these Terms; or
    (b) any loss of profit, loss of revenue, loss of interest, loss of data, loss of goodwill or loss of business opportunities, business interruption arising directly or indirectly out of or in relation to the Report or these Terms,

    irrespective of how that liability arises including in contract or tort, liability under indemnity or for any other common law, equitable or statutory cause of action or otherwise.
12. These Terms are subject to New South Wales law.

Photo 007	Close up of dark ash material from BH113

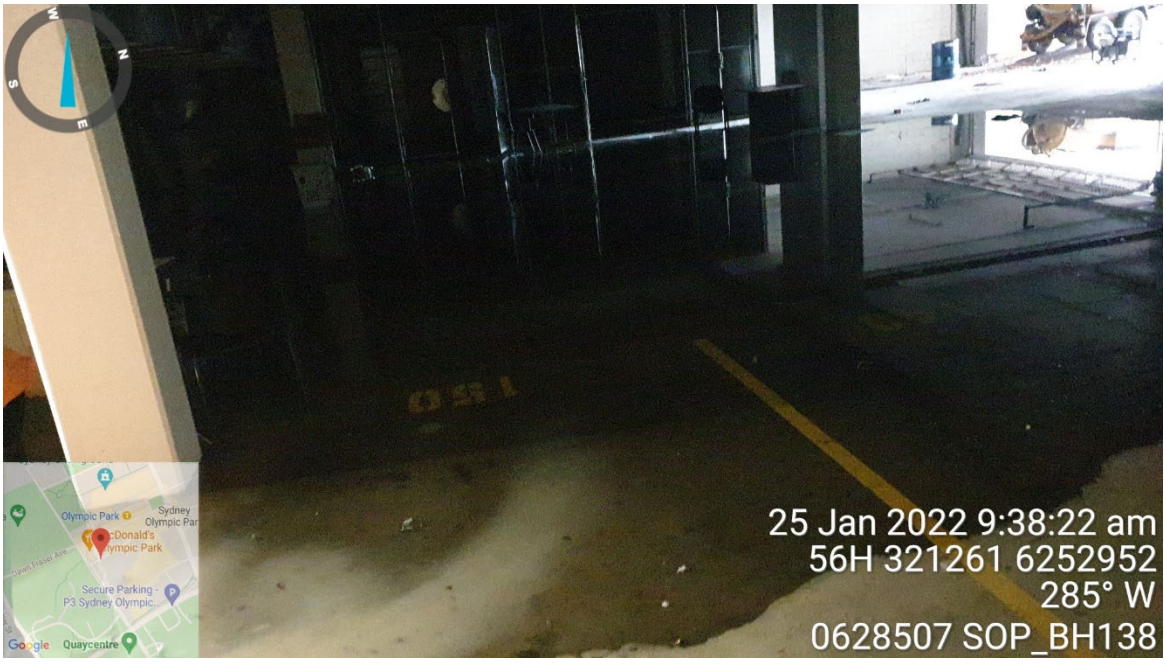

Photo 008	Surface of BH138- water pooling on concrete surface

Photo 009	Example material from push-tube in BH119.

Photo 010	Material profile of location BH121 showing concrete slab, roadbase and underlying natural shales

APPENDIX E DATA QUALITY ASSESSMENT

1. QUALITY ASSURANCE AND QUALITY CONTROL

The objective of this data assessment is to evaluate the quality of data gathered during the assessment detailed in this report. This process has been undertaken to assess whether the sample data is of a suitable standard to be utilised in this report. The data assessment consists of comparing field and laboratory QA/QC results to documented NEPC, ANZECC, USEPA SW-846 guidelines, USEPA CLP National Functional Guidelines for Inorganic and Organic Data Review, and other internationally recognised publications. The data assessment has been prepared in accordance with the ASC NEPM. Particular reference is made to the PARCC parameters (precision, accuracy, representativeness, completeness and comparability) in evaluating the data quality.

Table E1 below discusses the QA/QC measures pertinent to the site investigation sampling. **Table E2** presented at the end of this annex identifies laboratory reports relevant to the investigation works.

Table E1: Field QA/QC Assessment

QA/QC Criterion	Comments
QA/QC program includes intra-laboratory duplicates and inter-laboratory duplicates samples	Field duplicate samples, including intra and inter laboratory duplicates were collected at a minimum ratio of one duplicate to twenty primary samples (5%). For PFAS sampling, intra and inter laboratory duplicates were collected at a minimum ratio of one duplicate to ten primary samples (10%). **Soil:** The Relative Percentage Difference (RPDs) of soil duplicate sample pairs were generally within the acceptance limits (30% RPD (or 50% RPD for organics) where one or both values were greater than 10 x LOR or 50% RPD where one or both values were less than 10 x LOR). RPDs for all soil duplicate pairs are presented in Table E4a. Based on the results obtained from the soil RPDs, it is considered that the dataset quality is adequate and acceptable for the purposes of the Detailed Site Investigation. The following information is noted: Of the 99 primary soil samples analysed, nine intra-laboratory field duplicate samples and five inter-laboratory field duplicate sample were collected, at a rate of 9 and 5% for each, which was above the required frequency of 5%. Soil samples were not homogenised prior to splitting to minimise potential loss of volatile analytes. A total of 991 soil RPDs were calculated, the majority of which were reported to be within the aforementioned criteria, with 15 soil RPD results (1.5%) reported outside of RPD limits, with 14 of those were for sample results <10 times the LOR. Exceedances of the soil RPD criteria were considered likely to be due to matrix heterogeneity between primary and duplicate samples collected of fill materials from the site. **Water:** The Relative Percentage Difference (RPDs) of water duplicate sample pairs were generally within the acceptance limits (30% RPD (or 50% RPD for organics) where one or both values were greater than 10 x LOR or 50% RPD where one or both values were less than 10 x LOR). RPDs for all water duplicate pairs are presented in Table E4b. Based on the results obtained from the water RPDs, it is considered that the dataset quality is adequate and acceptable for the purposes of the Detailed Site Investigation. The following information is noted: Of the 7 primary water samples analysed, one intra-laboratory field duplicate sample and one inter-laboratory field duplicate sample were collected, however the intra-laboratory duplicate was analysed by the primary laboratory in error. A total of 190 water RPDs were calculated, the majority of which were reported to be within the aforementioned criteria, with 2 water RPD results (1%) reported outside of RPD limits, with both of those occurring for sample results <10 times the LOR.

QA/QC Criterion	Comments
	In all instances, results from both primary and duplicate samples have been used for the purpose of the investigations. As such, where duplicate RPDs were reported outside of acceptable limits, the variability in concentrations between samples have been accounted for in decision-making, and are therefore not considered to affect the overall conclusions or usability of the dataset as a whole.
Appropriate decontamination procedures were adopted	**Soil:** Soil samples were collected using a fresh pair of nitrile gloves. Soils were either collected from the push tube sleeve, hand auger, solid flight auger or from cutting from air rotary drilling. Decontamination of down hole drilling equipment prior to starting each new location was conducted, and collection of rinsate samples was conducted to evaluate the decontamination process. **Water:** Decontamination of the non-dedicated sampling equipment (interface probe and bladder pump was conducted between locations by scrubbing or wiping the equipment in a solution of Liquinox and water, and then rinsing using deionised water. Rinsate Blank results (for both soil and groundwater fieldworks) are shown in Table E5 Concentrations of COPCs were not detected above the laboratory LOR in any rinsate blank samples collected with the exception of minor detections of ammonia in R01_220119 and PFOS and PFOA in samples R01_20220221 and R01_20220222. These rinsate samples were collected during the groundwater sampling on the 19 January 2022 and 21st and 22nd February 2022. It should be noted that primary samples collected on these days did not report detections of PFAS in any of the samples collected indicating that cross contamination of PFAS is unlikely to have affected sample results.
All relevant media assessed	The scope involved soil and groundwater sampling, and the collection of field readings from ground gas wells. Soil samples were collected from various depths within the soil profile and were submitted for laboratory analysis. Groundwater sampling was conducted at depths representative of the Sites groundwater and as part of a larger groundwater monitoring program across multiple Sydney Metro Station sites.
Appropriateness of Sampling Strategy	Investigation locations were chosen to provide adequate coverage of the Site and assess potential sources of contamination. Additionally to provide waste classification data for materials within the Station Box. A sampling strategy was designed based on the conceptual site model and is considered appropriate to meet the project objectives.
Trip Blank and Trip Spikes Collected	A total of two laboratory-prepared soil trip blank samples, were prepared, stored and transported with soil samples. Soil trip blanks are presented in Table E6a. A total of six laboratory-prepared water trip blank samples, were prepared, stored and transported with water samples (this includes he sample labelled TripSpike that was a mislabelled trip blank). Water trip blanks are presented in Table E6c. The concentrations of COPCs (BTEX) in trip blanks were reported below the laboratory LOR for all samples analysed, indicating a low likelihood of cross-contamination having occurred during transport and storage of samples. Four laboratory prepared soil trip spike (TS) samples and four laboratory prepared water trip spike (TS) samples were analysed as part of the investigation. Soil trip spike results are presented in Table E6b and water trip spike results are presented in Table E6c. Trip spikes submitted were all reported within the acceptable recovery range (70-130%) indicating appropriate sample presentation during transport and storage of samples. It is noted that one sample labelled Trip Spike was a mislabelled trip blank as confirmed in correspondence with the laboratory, provided in Appendix F.

QA/QC Criterion	Comments
Sample Collection, handling, and transportation procedures	Borelogs describing the media sampled, sampling locations, observations of potential contamination (e.g. odour) and field QA/QC samples were completed. Soil encountered was also photographed (Appendix A and B). Soil samples were placed in laboratory supplied sample jars, stored in a chilled cooler on ice, and forwarded to the NATA-accredited laboratory under COC conditions. The methods used to collect the samples, the types of sample containers, preservation techniques and custody protocols were generally documented appropriately. Attempts to chill were recorded as present by the laboratory upon sample receipt.
Sampling is representative of the site conditions	The number and type of samples collected were considered to be appropriate and in accordance with the NSW EPA Sampling Design Guidelines (1995) with minimum sampling density requirement for the site having been achieved. While site operations prevented the access of two on-site groundwater monitoring locations, data from previous sampling was used in the Detailed Site Investigation to assess groundwater conditions at the site.
Other field QA/QC	Field instruments used as part of the investigation were appropriately calibrated and used according to the manufacturer's instructions. Calibration records are included in Appendix C.

Table E2 below summarises the laboratory's QA/QC measures pertinent to the analytical program.

Table E2: Laboratory QA/QC Assessment

QA/QC criterion	Comments
Appropriate methodologies used for sample analyses	The laboratories used for the investigation works were NATA accredited ALS (NATA Registration No. 825) and Eurofins (NATA Registration No. 1261). All laboratory reports were NATA stamped and signed by a NATA signatory. All methodologies were considered appropriate for the identified contaminants of concern in the matrix.
Appropriate Limit of Reporting	The laboratory LOR for each analyte is presented in the laboratory reports and summary tables. LORs were appropriate to allow screening of results against the nominated criteria with the exception of PFOS and some PAHs in water, where the LORs were above ecological screening criteria. ERM notes that there are laboratory limitations with meeting the criteria used. ERM also notes that during dewatering, treatment of groundwater is proposed prior to discharge to waters containing ecological receptors, and that site specific impacts will be assessed and managed under an Environmental Protection Licence (EPL).
Laboratory QA/QC Plan	Copies of signed chain of custody forms were returned by the laboratory. The primary and secondary laboratories were NATA accredited. It is noted that all analytical methods completed were NATA approved as documented on the laboratory reports. Laboratory reports indicate results not covered by NATA accreditation which were limited to calculations of totals (e.g. total BTEX, total PAH). Laboratory quality control samples included laboratory control samples, internal duplicates, matrix spikes and method blanks. The types of QA/QC samples analysed by the laboratory for the documented samples were considered sufficient to assess the precision and accuracy of the laboratory methods used. The data presented in the laboratory QA/QC reports were considered adequate in demonstrating the precision and accuracy of the methods used to analyse field samples.

Table E3 summarises the QA/QC results in relation to the data quality indicators of precision, accuracy, representativeness, comparability and completeness for the investigation sampling program.

Table E3: Overall Sampling and Analysis Methodology Assessment

Field Considerations	Laboratory Considerations
Precision Requirements	
The soil and groundwater sampling was conducted following ERM's SOPs and any variations from these procedures were documented.	Analysis of the following were reported: ■ Laboratory duplicates; and ■ Field intra- and inter- laboratory duplicates;
Precision Comments	
No significant variations from ERM's SOPs were noted. Field and laboratory duplicates were generally reported within the acceptance limits. Minor exceedances were noted, as presented in Table E1.	

Field Considerations	Laboratory Considerations
Accuracy Requirements	
The soil sampling was conducted following ERM's SOPs and any variations from these procedures were documented.	Analysis of the following were reported: ■ Trip blanks; ■ Method blanks; ■ Matrix spikes; ■ Surrogate spikes; and ■ Laboratory control samples.
Accuracy Comments	
Decontamination of the down hole drilling equipment was conducted prior to drilling at each location and decontamination of the interface probe and bladder pump were conducted between groundwater monitoring locations. Rinsate samples were collected and considered acceptable for the purposes of this investigation. Minor non-conformances reported as discussed in Table E1. Overall decontamination procedures were adequate. No significant variations from ERM SOPs were noted. Laboratory QA/QC samples were generally reported within the acceptance limits specified in the laboratory reports.	
Representativeness Requirements	
Appropriate media were identified and sampled.	Samples were analysed according to the Sampling and Analysis Plan.
Representativeness Comments	
The number and type of samples collected as part of investigation works was considered to be representative of the Site**.** The number and locations of boreholes was generally in accordance with the SAQP. While on-site groundwater sampling locations were not accessible, ERM has incorporated historical groundwater results from these locations to enable evaluation of site conditions. ERM considers that sufficient data is available to establish a representative dataset across the site for the purposes of the investigation.	
Comparability Requirements	
■ SOPs were used. ■ All sampling was conducted by an appropriately qualified and experienced sampler. ■ Impacts of climatic conditions on sample integrity were minimised by storing samples in a chilled cooler. ■ The types of samples collected were consistent.	■ Analytical methods suitable for the target media were used. ■ The laboratory LORs used to report analyte concentrations were less than the adopted investigation criteria. ■ Results of laboratory analysis comparable with field screening results where applicable (field observations, PID screening).
Comparability Comments	
The laboratory LOR for each analyte is presented in the laboratory reports and summary tables.	

Completeness Requirements

- Relevant locations were sampled.
- The sampling program was conducted following ERM's SOPs and any variations from these procedures were documented.
- All sampling was conducted by an appropriately qualified and experienced sampler.
- Documentation of field works was provided (refer Appendices A, B and C).
- All critical samples were analysed.
- All analytes were analysed according to the Sampling and Analysis Plan.
- Appropriate analysis methods and laboratory LORs were used in the majority of cases.
- Sample documentation was provided.
- Sample holding times were generally complied with.

Completeness Comments

The number and type of samples collected were considered to be representative of the Site. Evaluation of soil for asbestos in fill was only able to be done to a limited degree due to boreholes being used to collect samples and inspect soil.

*RPDs have only been considered where a concentration is greater than 1 times the EQL.
**High RPDs are in bold (Acceptable RPDs for each EQL multiplier range are: 50 (1-10 x EQL); 30 (10-30 x EQL); 30 (> 30 x EQL))
***Interlab Duplicates are matched on a per compound basis as methods vary between laboratories. Any methods in the row header relate to those used in the primary laboratory

*RPDs have only been considered where a concentration is greater than 1 times the EQL.
**High RPDs are in bold (Acceptable RPDs for each EQL multiplier range are: 50 (1-10 x EQL); 30 (10-30 x EQL); 30 (> 30 x E
***Interlab Duplicates are matched on a per compound basis as methods vary between laboratories. Any methods in the row h

Sample Receipt Advice

Company name:	ERM Sydney
Contact name:	Jessica Lawrence
Project name:	SOP
Project ID:	628507
Turnaround time:	5 Day
Date/Time received	Jan 25, 2022 4:06 PM
Eurofins reference	858847

Sample Information

✓	A detailed list of analytes logged into our LIMS, is included in the attached summary table.
✓	All samples have been received as described on the above COC.
✓	COC has been completed correctly.
✓	Attempt to chill was evident.
✓	Appropriately preserved sample containers have been used.
✓	All samples were received in good condition.
✓	Samples have been provided with adequate time to commence analysis in accordance with the relevant holding times.
✓	Appropriate sample containers have been used.
✓	Sample containers for volatile analysis received with zero headspace.
X	Split sample sent to requested external lab.
X	Some samples have been subcontracted.
N/A	Custody Seals intact (if used).

Notes

Contact

If you have any questions with respect to these samples, please contact your Analytical Services Manager:

John Nguyen on phone : or by email: JohnNguyen@eurofins.com

Results will be delivered electronically via email to Jessica Lawrence - jessica.lawrence@erm.com.

Note: A copy of these results will also be delivered to the general ERM Sydney email address.

Sample History

Where samples are submitted/analysed over several days, the last date of extraction is reported.

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Description	Testing Site	Extracted	Holding Time

Comments

Sample Integrity

Custody Seals Intact (if used)	N/A
Attempt to Chill was evident	Yes
Sample correctly preserved	Yes
Appropriate sample containers have been used	Yes
Sample containers for volatile analysis received with minimal headspace	Yes
Samples received within HoldingTime	Yes
Some samples have been subcontracted	No

Qualifier Codes/Comments

Code	Description
N01	F2 is determined by arithmetically subtracting the "naphthalene" value from the ">C10-C16" value. The naphthalene value used in this calculation is obtained from volatiles (Purge & Trap analysis).
N02	Where we have reported both volatile (P&T GCMS) and semivolatile (GCMS) naphthalene data, results may not be identical. Provided correct sample handling protocols have been followed, any observed differences in results are likely to be due to procedural differences within each methodology. Results determined by both techniques have passed all QAQC acceptance criteria, and are entirely technically valid.
N04	F1 is determined by arithmetically subtracting the "Total BTEX" value from the "C6-C10" value. The "Total BTEX" value is obtained by summing the concentrations of BTEX analytes. The "C6-C10" value is obtained by quantitating against a standard of mixed aromatic/aliphatic analytes.
N07	Please note:- These two PAH isomers closely co-elute using the most contemporary analytical methods and both the reported concentration (and the TEQ) apply specifically to the total of the two co-eluting PAHs
Q08	The matrix spike recovery is outside of the recommended acceptance criteria. An acceptable recovery was obtained for the laboratory control sample indicating a sample matrix interference.
Q15	The RPD reported passes Eurofins Environment Testing's QC - Acceptance Criteria as defined in the Internal Quality Control Review and Glossary page of this report.

Sample History

Where samples are submitted/analysed over several days, the last date of extraction is reported.

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Description	Testing Site	Extracted	Holding Time
Total Recoverable Hydrocarbons - 1999 NEPM Fractions	Sydney	Feb 01, 2022	14 Days
- Method: LTM-ORG-2010 TRH C6-C40			
Total Recoverable Hydrocarbons - 2013 NEPM Fractions	Sydney	Feb 01, 2022	14 Days
- Method: LTM-ORG-2010 TRH C6-C40

Comments

Sample Integrity

Custody Seals Intact (if used)	N/A
Attempt to Chill was evident	Yes
Sample correctly preserved	Yes
Appropriate sample containers have been used	Yes
Sample containers for volatile analysis received with minimal headspace	Yes
Samples received within HoldingTime	Yes
Some samples have been subcontracted	No

Qualifier Codes/Comments

Code	Description
N01	F2 is determined by arithmetically subtracting the "naphthalene" value from the ">C10-C16" value. The naphthalene value used in this calculation is obtained from volatiles (Purge & Trap analysis).
N02	Where we have reported both volatile (P&T GCMS) and semivolatile (GCMS) naphthalene data, results may not be identical. Provided correct sample handling protocols have been followed, any observed differences in results are likely to be due to procedural differences within each methodology. Results determined by both techniques have passed all QAQC acceptance criteria, and are entirely technically valid.
N04	F1 is determined by arithmetically subtracting the "Total BTEX" value from the "C6-C10" value. The "Total BTEX" value is obtained by summing the concentrations of BTEX analytes. The "C6-C10" value is obtained by quantitating against a standard of mixed aromatic/aliphatic analytes.
N07	Please note:- These two PAH isomers closely co-elute using the most contemporary analytical methods and both the reported concentration (and the TEQ) apply specifically to the total of the two co-eluting PAHs
N11	Isotope dilution is used for calibration of each native compound for which an exact labelled analogue is available (Isotope Dilution Quantitation). The isotopically labelled analogues allow identification and recovery correction of the concentration of the associated native PFAS compounds.
Q08	The matrix spike recovery is outside of the recommended acceptance criteria. An acceptable recovery was obtained for the laboratory control sample indicating a sample matrix interference.
Q15	The RPD reported passes Eurofins Environment Testing's QC - Acceptance Criteria as defined in the Internal Quality Control Review and Glossary page of this report.

Sample History

Where samples are submitted/analysed over several days, the last date of extraction is reported.

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Description	Testing Site	Extracted	Holding Time

Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples follows guidelines delineated in the National Environment Protection (Assessment of Site Contamination) Measure 1999, as amended May 2013 and are included in this QC report where applicable. Additional QC data may be available on request.
2. All soil/sediment/solid results are reported on a dry basis, unless otherwise stated.
3. All biota/food results are reported on a wet weight basis on the edible portion, unless otherwise stated.
4. Actual LORs are matrix dependant. Quoted LORs may be raised where sample extracts are diluted due to interferences.
5. Results are uncorrected for matrix spikes or surrogate recoveries except for PFAS compounds.
6. SVOC analysis on waters are performed on homogenised, unfiltered samples, unless noted otherwise.
7. Samples were analysed on an 'as received' basis.
8. Information identified on this report with blue colour, indicates data provided by customer that may have an impact on the results.
9. This report replaces any interim results previously issued.

Holding Times

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the SRA.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

For VOCs containing vinyl chloride, styrene and 2-chloroethyl vinyl ether the holding time is 7 days however for all other VOCs such as BTEX or C6-10 TRH then the holding time is 14 days.

Units

mg/kg: milligrams per kilogram
mg/L: milligrams per litre
µg/L: micrograms per litre
ppm: parts per million
ppb: parts per billion
%: Percentage
org/100 mL: Organisms per 100 millilitres
NTU: Nephelometric Turbidity Units
MPN/100 mL: Most Probable Number of organisms per 100 millilitres

Terms

APHA	American Public Health Association
COC	Chain of Custody
CP	Client Parent - QC was performed on samples pertaining to this report
CRM	Certified Reference Material (ISO17034) - reported as percent recovery.
Dry	Where a moisture has been determined on a solid sample the result is expressed on a dry basis.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
LOR	Limit of Reporting.
LCS	Laboratory Control Sample - reported as percent recovery.
Method Blank	In the case of solid samples these are performed on laboratory certified clean sands and in the case of water samples these are performed on de-ionised water.
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
SRA	Sample Receipt Advice
Surr - Surrogate	The addition of a like compound to the analyte target and reported as percentage recovery.
TBTO	Tributyltin oxide (*bis*-tributyltin oxide) - individual tributyltin compounds cannot be identified separately in the environment however free tributyltin was measured and its values were converted stoichiometrically into tributyltin oxide for comparison with regulatory limits.
TCLP	Toxicity Characteristic Leaching Procedure
TEQ	Toxic Equivalency Quotient or Total Equivalence
QSM	US Department of Defense Quality Systems Manual Version 5.4
US EPA	United States Environmental Protection Agency
WA DWER	Sum of PFBA, PFPeA, PFHxA, PFHpA, PFOA, PFBS, PFHxS, PFOS, 6:2 FTSA, 8:2 FTSA

QC - Acceptance Criteria

The acceptance criteria should be used as a guide only and may be different when site specific Sampling Analysis and Quality Plan (SAQP) have been implemented

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:

Results <10 times the LOR: No Limit

Results between 10-20 times the LOR: RPD must lie between 0-50%

Results >20 times the LOR : RPD must lie between 0-30%

NOTE: pH duplicates are reported as a range not as RPD

Surrogate Recoveries: Recoveries must lie between 20-130% for Speciated Phenols & 50-150% for PFAS

PFAS field samples that contain surrogate recoveries in excess of the QC limit designated in QSM 5.4 where no positive PFAS results have been reported have been reviewed and no data was affected.

.

QC Data General Comments

1. Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.
3. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling. Therefore, laboratory analysis is unlikely to be completed within holding time.Analysis will begin as soon as possible after sample receipt.
4. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of recovery the term "INT" appears against that analyte.
5. For Matrix Spikes and LCS results a dash "-" in the report means that the specific analyte was not added to the QC sample.
6. Duplicate RPDs are calculated from raw analytical data thus it is possible to have two sets of data.

Sample Integrity

Custody Seals Intact (if used)	N/A
Attempt to Chill was evident	Yes
Sample correctly preserved	Yes
Appropriate sample containers have been used	Yes
Sample containers for volatile analysis received with minimal headspace	Yes
Samples received within HoldingTime	Yes
Some samples have been subcontracted	No

Qualifier Codes/Comments

Code	Description
N01	F2 is determined by arithmetically subtracting the "naphthalene" value from the ">C10-C16" value. The naphthalene value used in this calculation is obtained from volatiles (Purge & Trap analysis).
N02	Where we have reported both volatile (P&T GCMS) and semivolatile (GCMS) naphthalene data, results may not be identical. Provided correct sample handling protocols have been followed, any observed differences in results are likely to be due to procedural differences within each methodology. Results determined by both techniques have passed all QAQC acceptance criteria, and are entirely technically valid.
N04	F1 is determined by arithmetically subtracting the "Total BTEX" value from the "C6-C10" value. The "Total BTEX" value is obtained by summing the concentrations of BTEX analytes. The "C6-C10" value is obtained by quantitating against a standard of mixed aromatic/aliphatic analytes.
N07	Please note:- These two PAH isomers closely co-elute using the most contemporary analytical methods and both the reported concentration (and the TEQ) apply specifically to the total of the two co-eluting PAHs
N11	Isotope dilution is used for calibration of each native compound for which an exact labelled analogue is available (Isotope Dilution Quantitation). The isotopically labelled analogues allow identification and recovery correction of the concentration of the associated native PFAS compounds.

Edwandy Fadjar	Organic Coordinator	Sydney Organics, Smithfield, NSW
Ivan Taylor	Analyst	Sydney Inorganics, Smithfield, NSW

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP075 (SIM): Where reported, Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) per the NEPM (2013) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benz(a)anthracene (0.1), Chrysene (0.01), Benzo(b+j) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1.2.3.cd)pyrene (0.1), Dibenz(a.h)anthracene (1.0), Benzo(g.h.i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero.
- EP080: Where reported, Total Xylenes is the sum of the reported concentrations of m&p-Xylene and o-Xylene at or above the LOR.
- EP074: Where reported, Total Trihalomethanes is the sum of the reported concentrations of all Trihalomethanes at or above the LOR.
- EP074: Where reported, Total Trimethylbenzenes is the sum of the reported concentrations of 1.2.3-Trimethylbenzene, 1.2.4-Trimethylbenzene and 1.3.5-Trimethylbenzene at or above the LOR.
- EP075(SIM): Where reported, Total Cresol is the sum of the reported concentrations of 2-Methylphenol and 3- & 4-Methylphenol at or above the LOR.
- TDS by method EA-015 may bias high for various samples due to the presence of fine particulate matter, which may pass through the prescribed GF/C paper.
- EK057G: It has been noted that Nitrite is greater than NOx on sample 1, however this difference is within the limits of experimental variation.
- It has been noted that Nitrite is greater than NOx, however this difference is within the limits of experimental variation.
- EP080: Sample TRIP SPIKE contains volatile compounds spiked into the sample containers prior to dispatch from the laboratory. BTEXN compounds spiked at 20 ug/L.
- Sodium Adsorption Ratio (where reported): Where results for Na, Ca or Mg are <LOR, a concentration at half the reported LOR is incorporated into the SAR calculation. This represents a conservative approach for Na relative to the assumption that <LOR = zero concentration and a conservative approach for Ca & Mg relative to the assumption that <LOR is equivalent to the LOR concentration.

No. of samples received	: 8		
No. of samples analysed	: 8		

ilac-MRA NATA
Accreditation No. 825
Accredited for compliance with ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Ankit Joshi	Inorganic Chemist	Sydney Inorganics, Smithfield, NSW
Edwandy Fadjar	Organic Coordinator	Sydney Organics, Smithfield, NSW
Ivan Taylor	Analyst	Sydney Inorganics, Smithfield, NSW

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Sub-Matrix: **WATER**

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

Sub-Matrix: **WATER**

ALS Environmental

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **ES2201561**	Page	: 1 of 11
Client	: **ENVIRONMENTAL RESOURCES MANAGEMENT (ERM)**	Laboratory	: Environmental Division Sydney
Contact	: NICHOLAS GRBICH	Telephone	: +61-2-8784 8555
Project	: 0628507	Date Samples Received	: 18-Jan-2022
Site	: ----	Issue Date	: 25-Jan-2022
Sampler	: Taj Morrison	No. of samples received	: 8
Order number	: ----	No. of samples analysed	: 8

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **Matrix Spike outliers exist - please see following pages for full details.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **Quality Control Sample Frequency Outliers exist - please see following pages for full details.**

Outliers : Quality Control Samples

Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Matrix: **WATER**

Compound Group Name	Laboratory Sample ID	Client Sample ID	Analyte	CAS Number	Data	Limits	Comment
Matrix Spike (MS) Recoveries							
ED041G: Sulfate (Turbidimetric) as SO4 2- by DA	ES2201473--001	Anonymous	**Sulfate as SO4 - Turbidimetric**	14808-79-8	Not Determined	----	**MS recovery not determined, background level greater than or equal to 4x spike level.**
ED045G: Chloride by Discrete Analyser	ES2201473--001	Anonymous	**Chloride**	16887-00-6	Not Determined	----	**MS recovery not determined, background level greater than or equal to 4x spike level.**
EK055G: Ammonia as N by Discrete Analyser	ES2201561--004	SMW_BH035	**Ammonia as N**	7664-41-7	Not Determined	----	**MS recovery not determined, background level greater than or equal to 4x spike level.**
EK067G: Total Phosphorus as P by Discrete Analyser	ES2201561--002	SMW_BH035_S	**Total Phosphorus as P**	----	Not Determined	----	**MS recovery not determined, background level greater than or equal to 4x spike level.**

Outliers : Frequency of Quality Control Samples

Matrix: **WATER**

Quality Control Sample Type	Count		Rate (%)		Quality Control Specification
Method	QC	Regular	Actual	Expected	
Laboratory Duplicates (DUP)					
PAH/Phenols (GC/MS - SIM)	0	13	0.00	10.00	NEPM 2013 B3 & ALS QC Standard
TRH - Semivolatile Fraction	0	14	0.00	10.00	NEPM 2013 B3 & ALS QC Standard
Matrix Spikes (MS)					
PAH/Phenols (GC/MS - SIM)	0	13	0.00	5.00	NEPM 2013 B3 & ALS QC Standard
TRH - Semivolatile Fraction	0	14	0.00	5.00	NEPM 2013 B3 & ALS QC Standard

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **WATER**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **WATER**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Total Dissolved Solids (High Level)	EA015H	WATER	In house: Referenced to APHA 2540C. A gravimetric procedure that determines the amount of `filterable` residue in an aqueous sample. A well-mixed sample is filtered through a glass fibre filter (1.2um). The filtrate is evaporated to dryness and dried to constant weight at 180+/-5C. This method is compliant with NEPM Schedule B(3)
Alkalinity by PC Titrator	ED037-P	WATER	In house: Referenced to APHA 2320 B This procedure determines alkalinity by automated measurement (e.g. PC Titrate) on a settled supernatant aliquot of the sample using pH 4.5 for indicating the total alkalinity end-point. This method is compliant with NEPM Schedule B(3)
Sulfate (Turbidimetric) as SO4 2- by Discrete Analyser	ED041G	WATER	In house: Referenced to APHA 4500-SO4. Dissolved sulfate is determined in a 0.45um filtered sample. Sulfate ions are converted to a barium sulfate suspension in an acetic acid medium with barium chloride. Light absorbance of the BaSO4 suspension is measured by a photometer and the SO4-2 concentration is determined by comparison of the reading with a standard curve. This method is compliant with NEPM Schedule B(3)
Chloride by Discrete Analyser	ED045G	WATER	In house: Referenced to APHA 4500 Cl - G.The thiocyanate ion is liberated from mercuric thiocyanate through sequestration of mercury by the chloride ion to form non-ionised mercuric chloride.in the presence of ferric ions the librated thiocynate forms highly-coloured ferric thiocynate which is measured at 480 nm APHA seal method 2 017-1-L
Major Cations - Dissolved	ED093F	WATER	In house: Referenced to APHA 3120 and 3125; USEPA SW 846 - 6010 and 6020; Cations are determined by either ICP-AES or ICP-MS techniques. This method is compliant with NEPM Schedule B(3) Sodium Adsorption Ratio is calculated from Ca, Mg and Na which determined by ALS in house method QWI-EN/ED093F. This method is compliant with NEPM Schedule B(3) Hardness parameters are calculated based on APHA 2340 B. This method is compliant with NEPM Schedule B(3)
Dissolved Metals by ICP-MS - Suite A	EG020A-F	WATER	In house: Referenced to APHA 3125; USEPA SW846 - 6020, ALS QWI-EN/EG020. Samples are 0.45µm filtered prior to analysis. The ICPMS technique utilizes a highly efficient argon plasma to ionize selected elements. Ions are then passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to their measurement by a discrete dynode ion detector.
Total Metals by ICP-MS - Suite A	EG020A-T	WATER	In house: Referenced to APHA 3125; USEPA SW846 - 6020, ALS QWI-EN/EG020. The ICPMS technique utilizes a highly efficient argon plasma to ionize selected elements. Ions are then passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to their measurement by a discrete dynode ion detector.
Dissolved Mercury by FIMS	EG035F	WATER	In house: Referenced to APHA 3112 Hg - B (Flow-injection (SnCl2)(Cold Vapour generation) AAS) Samples are 0.45µm filtered prior to analysis. FIM-AAS is an automated flameless atomic absorption technique. A bromate/bromide reagent is used to oxidise any organic mercury compounds in the filtered sample. The ionic mercury is reduced online to atomic mercury vapour by SnCl2 which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM Schedule B(3).

Analytical Methods	Method	Matrix	Method Descriptions
Total Mercury by FIMS	EG035T	WATER	In house: Referenced to APHA 3112 Hg - B (Flow-injection (SnCl2)(Cold Vapour generation) AAS) FIM-AAS is an automated flameless atomic absorption technique. A bromate/bromide reagent is used to oxidise any organic mercury compounds in the unfiltered sample. The ionic mercury is reduced online to atomic mercury vapour by SnCl2 which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM Schedule B(3).
Ammonia as N by Discrete analyser	EK055G	WATER	In house: Referenced to APHA 4500-NH3 G Ammonia is determined by direct colorimetry by Discrete Analyser. This method is compliant with NEPM Schedule B(3)
Nitrite as N by Discrete Analyser	EK057G	WATER	In house: Referenced to APHA 4500-NO2- B. Nitrite is determined by direct colourimetry by Discrete Analyser. This method is compliant with NEPM Schedule B(3)
Nitrate as N by Discrete Analyser	EK058G	WATER	In house: Referenced to APHA 4500-NO3- F. Nitrate is reduced to nitrite by way of a chemical reduction followed by quantification by Discrete Analyser. Nitrite is determined seperately by direct colourimetry and result for Nitrate calculated as the difference between the two results. This method is compliant with NEPM Schedule B(3)
Nitrite and Nitrate as N (NOx) by Discrete Analyser	EK059G	WATER	In house: Referenced to APHA 4500-NO3- F. Combined oxidised Nitrogen (NO2+NO3) is determined by Chemical Reduction and direct colourimetry by Discrete Analyser. This method is compliant with NEPM Schedule B(3)
Total Kjeldahl Nitrogen as N By Discrete Analyser	EK061G	WATER	In house: Referenced to APHA 4500-Norg D (In house). An aliquot of sample is digested using a high temperature Kjeldahl digestion to convert nitrogenous compounds to ammonia. Ammonia is determined colorimetrically by discrete analyser. This method is compliant with NEPM Schedule B(3)
Total Nitrogen as N (TKN + Nox) By Discrete Analyser	EK062G	WATER	In house: Referenced to APHA 4500-Norg / 4500-NO3-. This method is compliant with NEPM Schedule B(3)
Total Phosphorus as P By Discrete Analyser	EK067G	WATER	In house: Referenced to APHA 4500-P H, Jirka et al, Zhang et al. This procedure involves sulphuric acid digestion of a sample aliquot to break phosphorus down to orthophosphate. The orthophosphate reacts with ammonium molybdate and antimony potassium tartrate to form a complex which is then reduced and its concentration measured at 880nm using discrete analyser. This method is compliant with NEPM Schedule B(3)
Ionic Balance by PCT DA and Turbi SO4 DA	* EN055 - PG	WATER	In house: Referenced to APHA 1030F. This method is compliant with NEPM Schedule B(3)
TRH - Semivolatile Fraction	EP071	WATER	In house: Referenced to USEPA SW 846 - 8015 The sample extract is analysed by Capillary GC/FID and quantification is by comparison against an established 5 point calibration curve of n-Alkane standards. This method is compliant with the QC requirements of NEPM Schedule B(3)
Volatile Organic Compounds	EP074	WATER	In house: Referenced to USEPA SW 846 - 8260 Water samples are directly purged prior to analysis by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM Schedule B(3)
PAH/Phenols (GC/MS - SIM)	EP075(SIM)	WATER	In house: Referenced to USEPA SW 846 - 8270 Sample extracts are analysed by Capillary GC/MS in SIM Mode and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM Schedule B(3)
TRH Volatiles/BTEX	EP080	WATER	In house: Referenced to USEPA SW 846 - 8260 Water samples are directly purged prior to analysis by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. Alternatively, a sample is equilibrated in a headspace vial and a portion of the headspace determined by GCMS analysis. This method is compliant with the QC requirements of NEPM Schedule B(3)

Preparation Methods	Method	Matrix	Method Descriptions

Preparation Methods	Method	Matrix	Method Descriptions
TKN/TP Digestion	EK061/EK067	WATER	In house: Referenced to APHA 4500 Norg - D; APHA 4500 P - H. This method is compliant with NEPM Schedule B(3)
Digestion for Total Recoverable Metals	EN25	WATER	In house: Referenced to USEPA SW846-3005. Method 3005 is a Nitric/Hydrochloric acid digestion procedure used to prepare surface and ground water samples for analysis by ICPAES or ICPMS. This method is compliant with NEPM Schedule B(3)
Separatory Funnel Extraction of Liquids	ORG14	WATER	In house: Referenced to USEPA SW 846 - 3510 100 mL to 1L of sample is transferred to a separatory funnel and serially extracted three times using DCM for each extract. The resultant extracts are combined, dehydrated and concentrated for analysis. This method is compliant with NEPM Schedule B(3) . ALS default excludes sediment which may be resident in the container.
Volatiles Water Preparation	ORG16-W	WATER	A 5 mL aliquot or 5 mL of a diluted sample is added to a 40 mL VOC vial for purging.

Accreditation No. 825
Accredited for compliance with ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Descriptive Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Alana Smylie	Asbestos Identifier	Newcastle - Asbestos, Mayfield West, NSW
Edwandy Fadjar	Organic Coordinator	Sydney Organics, Smithfield, NSW
Franco Lentini	LCMS Coordinator	Sydney Inorganics, Smithfield, NSW
Franco Lentini	LCMS Coordinator	Sydney Organics, Smithfield, NSW
Ivan Taylor	Analyst	Sydney Inorganics, Smithfield, NSW

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP075 (SIM): Where reported, Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) per the NEPM (2013) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benz(a)anthracene (0.1), Chrysene (0.01), Benzo(b+j) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1.2.3.cd)pyrene (0.1), Dibenz(a.h)anthracene (1.0), Benzo(g.h.i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero.
- EP075: Where reported, Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) per the NEPM (2013) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benz(a)anthracene (0.1), Chrysene (0.01), Benzo(b+j) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1.2.3.cd)pyrene (0.1), Dibenz(a.h)anthracene (1.0), Benzo(g.h.i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero.
- Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) per the NEPM (2013) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benz(a)anthracene (0.1), Chrysene (0.01), Benzo(b+j) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1.2.3.cd)pyrene (0.1), Dibenz(a.h)anthracene (1.0), Benzo(g.h.i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero, for 'TEQ 1/2LOR' are treated as half the reported LOR, and for 'TEQ LOR' are treated as being equal to the reported LOR. Note: TEQ 1/2LOR and TEQ LOR will calculate as 0.6mg/Kg and 1.2mg/Kg respectively for samples with non-detects for all of the eight TEQ PAHs.
- EP231X - Per- and Polyfluoroalkyl Substances (PFAS): Samples received in 20ml or 125ml bottles have been tested in accordance with the QSM5.3 compliant, NATA accredited method. 60mL or 250mL bottles have been tested to the legacy QSM 5.1 aligned, NATA accredited method.
- EP080: Where reported, Total Xylenes is the sum of the reported concentrations of m&p-Xylene and o-Xylene at or above the LOR.
- EP068: Where reported, Total Chlordane (sum) is the sum of the reported concentrations of cis-Chlordane and trans-Chlordane at or above the LOR.
- EP068: Where reported, Total OCP is the sum of the reported concentrations of all Organochlorine Pesticides at or above LOR.
- EP074: Where reported, Total Trihalomethanes is the sum of the reported concentrations of all Trihalomethanes at or above the LOR.
- EP074: Where reported, Total Xylenes is the sum of the reported concentrations of m&p-Xylene and o-Xylene at or above the LOR.
- EP074: Where reported, Sum of chlorinated hydrocarbons includes carbon tetrachloride, chlorobenzene, chloroform, 1,2-dichlorobenzene, 1,4-dichlorobenzene, 1,2-dichloroethane, 1,1-dichloroethene, cis-1,2-dichlorothene, trans-1,2-dichlorothene, 1,1,1,2-tetrachloroethane, 1,1,2,2-tetrachloroethane, 1,2,4-trichlorobenzene, 1,1,1-trichloroethane, 1,1,2-trichloroethane, trichloroethene, vinyl chloride, hexachlorobutadiene and methylene chloride.
- EP074: Where reported, Total Trimethylbenzenes is the sum of the reported concentrations of 1.2.3-Trimethylbenzene, 1.2.4-Trimethylbenzene and 1.3.5-Trimethylbenzene at or above the LOR.
- EP075(SIM): Where reported, Total Cresol is the sum of the reported concentrations of 2-Methylphenol and 3- & 4-Methylphenol at or above the LOR.
- EG005T: Poor precision was obtained for Zinc on sample ES2201943 # 002. Confirmed by redigestion and reanalysis.
- EP080: The trip spike and its control have been analysed for volatile TPH and BTEXN only. The trip spike and control were prepared in the lab using reagent grade sand spiked with petrol. The spike was dispatched from the lab and the control retained.
- EP075: Where reported, 'Sum of PAH' is the sum of the USEPA 16 priority PAHs
- EA200 'Am' Amosite (brown asbestos)

- EA200 'Cr' Crocidolite (blue asbestos)
- EA200 'Trace' - Asbestos fibres ("Free Fibres") detected by trace analysis per AS4964. The result can be interpreted that the sample contains detectable 'respirable' asbestos fibres
- EA200: Asbestos Identification Samples were analysed by Polarised Light Microscopy including dispersion staining.
- EA200 Legend
- EA200 'Ch' Chrysotile (white asbestos)
- EA200: 'UMF' Unknown Mineral Fibres. "-" indicates fibres detected may or may not be asbestos fibres. Confirmation by alternative techniques is recommended.
- Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benz(a)anthracene (0.1), Chrysene (0.01), Benzo(b+j) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1.2.3.cd)pyrene (0.1), Dibenz(a.h)anthracene (1.0), Benzo(g.h.i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero, for 'TEQ 1/2LOR' are treated as half the reported LOR, and for 'TEQ LOR' are treated as being equal to the reported LOR. Note: TEQ 1/2LOR and TEQ LOR will calculate as 0.6mg/Kg and 1.2mg/Kg respectively for samples with non-detects for all of the eight TEQ PAHs.
- EA200: For samples larger than 30g, the <2mm fraction may be sub-sampled prior to trace analysis as outlined in ISO23909:2008(E) Sect 6.3.2-2
- EA200: 'Yes' - Asbestos detected by polarised light microscopy including dispersion staining.
- EA200: 'No*' - No asbestos found, at the reporting limit of 0.1g/kg, by polarised light microscopy including dispersion staining. Asbestos material was detected and positively identified at concentrations estimated to be below 0.1g/kg.
- EA200: 'No' - No asbestos found at the reporting limit 0.1g/kg, by polarised light microscopy including dispersion staining.
- EP231: Stable isotope enriched internal standards are added to samples prior to extraction. Target compounds have a direct analogous internal standard with the exception of PFPeS, PFHpA, PFDS, PFTrDA and 10:2 FTS. These compounds use an internal standard that is chemically related and has a retention time close to that of the target compound. The DQO for internal standard response is 50-150% of that established at initial calibration. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These practices are in line with recommendations in the National Environmental Management Plan for PFAS (Australian HEPA) and also conform to QSM 5.3 (US DoD) requirements.

Inter-Laboratory Testing

Analysis conducted by ALS Newcastle, NATA accreditation no. 825, site no. 1656 (Chemistry) 9854 (Biology).

(SOIL) EA200: AS 4964 - 2004 Identification of Asbestos in Soils

ALS Environmental

QUALITY CONTROL REPORT

Work Order	: **ES2201683**	Page	: 1 of 52
Client	: **ENVIRONMENTAL RESOURCES MANAGEMENT (ERM)**	Laboratory	: Environmental Division Sydney
Contact	: MS JESSICA LAWRENCE	Contact	: Customer Services ES
Address	: LEVEL 15 309 KENT STREET SYDNEY NSW AUSTRALIA 2000	Address	: 277-289 Woodpark Road Smithfield NSW Australia 2164
Telephone	: +61 02 8584 8888	Telephone	: +61-2-8784 8555
Project	: 0628507 SOP	Date Samples Received	: 19-Jan-2022
Order number	: ----	Date Analysis Commenced	: 24-Jan-2022
C-O-C number	: ----	Issue Date	: 01-Feb-2022
Sampler	: Ant R		
Site	: ----		
Quote number	: EN/114		
No. of samples received	: 36		
No. of samples analysed	: 36		

Accreditation No. 825
Accredited for compliance with ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Alana Smylie	Asbestos Identifier	Newcastle - Asbestos, Mayfield West, NSW
Edwandy Fadjar	Organic Coordinator	Sydney Organics, Smithfield, NSW
Franco Lentini	LCMS Coordinator	Sydney Inorganics, Smithfield, NSW
Franco Lentini	LCMS Coordinator	Sydney Organics, Smithfield, NSW
Ivan Taylor	Analyst	Sydney Inorganics, Smithfield, NSW

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Sub-Matrix: **SOIL**

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Sub-Matrix: **SOIL**

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

Sub-Matrix: **SOIL**

ALS Environmental

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **ES2201683**	Page	: 1 of 25
Client	: **ENVIRONMENTAL RESOURCES MANAGEMENT (ERM)**	Laboratory	: Environmental Division Sydney
Contact	: MS JESSICA LAWRENCE	Telephone	: +61-2-8784 8555
Project	: 0628507 SOP	Date Samples Received	: 19-Jan-2022
Site	: ----	Issue Date	: 01-Feb-2022
Sampler	: Ant R	No. of samples received	: 36
Order number	: ----	No. of samples analysed	: 36

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **Duplicate outliers exist - please see following pages for full details.**
- **Laboratory Control outliers exist - please see following pages for full details.**
- **Matrix Spike outliers exist - please see following pages for full details.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **Quality Control Sample Frequency Outliers exist - please see following pages for full details.**

Outliers : Quality Control Samples

Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Matrix: **SOIL**

Compound Group Name	Laboratory Sample ID	Client Sample ID	Analyte	CAS Number	Data	Limits	Comment

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **SOIL**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **SOIL**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Moisture Content	EA055	SOIL	In house: A gravimetric procedure based on weight loss over a 12 hour drying period at 105-110 degrees C. This method is compliant with NEPM Schedule B(3).
Asbestos Identification in Soils	EA200	SOIL	AS 4964 Method for the qualitative identification of asbestos in bulk samples Analysis by Polarised Light Microscopy including dispersion staining
Total Metals by ICP-AES	EG005T	SOIL	In house: Referenced to APHA 3120; USEPA SW 846 - 6010. Metals are determined following an appropriate acid digestion of the soil. The ICPAES technique ionises samples in a plasma, emitting a characteristic spectrum based on metals present. Intensities at selected wavelengths are compared against those of matrix matched standards. This method is compliant with NEPM Schedule B(3)
Total Mercury by FIMS	EG035T	SOIL	In house: Referenced to APHA 3112 Hg - B (Flow-injection (SnCl2) (Cold Vapour generation) AAS) FIM-AAS is an automated flameless atomic absorption technique. Mercury in solids are determined following an appropriate acid digestion. Ionic mercury is reduced online to atomic mercury vapour by SnCl2 which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM Schedule B(3)
Polychlorinated Biphenyls (PCB)	EP066	SOIL	In house: Referenced to USEPA SW 846 - 8270 Extracts are analysed by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM Schedule B(3).
Pesticides by GCMS	EP068	SOIL	In house: Referenced to USEPA SW 846 - 8270 Extracts are analysed by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. This technique is compliant with NEPM Schedule B(3).
TRH - Semivolatile Fraction	EP071	SOIL	In house: Referenced to USEPA SW 846 - 8015 Sample extracts are analysed by Capillary GC/FID and quantified against alkane standards over the range C10 - C40. Compliant with NEPM Schedule B(3).
Volatile Organic Compounds	EP074	SOIL	In house: Referenced to USEPA SW 846 - 8260 Extracts are analysed by Purge and Trap, Capillary GC/MS. Quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM Schedule B(3).
Semivolatile Organic Compounds	EP075	SOIL	In house: Referenced to USEPA SW 846 - 8270 Extracts are analysed by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. This technique is compliant with NEPM Schedule B(3).
PAH/Phenols (SIM)	EP075(SIM)	SOIL	In house: Referenced to USEPA SW 846 - 8270. Extracts are analysed by Capillary GC/MS in Selective Ion Mode (SIM) and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM Schedule B(3)
TRH Volatiles/BTEX	EP080	SOIL	In house: Referenced to USEPA SW 846 - 8260. Extracts are analysed by Purge and Trap, Capillary GC/MS. Quantification is by comparison against an established 5 point calibration curve. Compliant with NEPM Schedule B(3) amended.

Analytical Methods	Method	Matrix	Method Descriptions
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	SOIL	In-house: Analysis of soils by solvent extraction followed by LC-Electrospray-MS-MS, Negative Mode using MRM using internal standard quantitation. Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to a portion of soil which is then extracted with MTBE and an ion pairing reagent. A portion of extract is exchanged into the analytical solvent mixture, combined with an equal volume reagent water and filtered for analysis. Method procedures and data quality objectives conform to US DoD QSM 5.3, table B-15 requirements.
Total Metals by ICP-MS - Suite A	EG020A-T	WATER	In house: Referenced to APHA 3125; USEPA SW846 - 6020, ALS QWI-EN/EG020. The ICPMS technique utilizes a highly efficient argon plasma to ionize selected elements. Ions are then passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to their measurement by a discrete dynode ion detector.
Total Mercury by FIMS	EG035T	WATER	In house: Referenced to APHA 3112 Hg - B (Flow-injection (SnCl2)(Cold Vapour generation) AAS) FIM-AAS is an automated flameless atomic absorption technique. A bromate/bromide reagent is used to oxidise any organic mercury compounds in the unfiltered sample. The ionic mercury is reduced online to atomic mercury vapour by SnCl2 which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM Schedule B(3).
Polychlorinated Biphenyls (PCB)	EP066	WATER	In house: Referenced to USEPA SW 846 - 8270 Sample extracts are analysed by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM Schedule B(3)
Pesticides by GCMS	EP068	WATER	In house: Referenced to USEPA SW 846 - 8270 Sample extracts are analysed by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM Schedule B(3)
TRH - Semivolatile Fraction	EP071	WATER	In house: Referenced to USEPA SW 846 - 8015 The sample extract is analysed by Capillary GC/FID and quantification is by comparison against an established 5 point calibration curve of n-Alkane standards. This method is compliant with the QC requirements of NEPM Schedule B(3)
Volatile Organic Compounds	EP074	WATER	In house: Referenced to USEPA SW 846 - 8260 Water samples are directly purged prior to analysis by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM Schedule B(3)
Semivolatile Organic Compounds	EP075	WATER	In house: Referenced to USEPA SW 846 - 8270 Sample extracts are analysed by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM Schedule B(3)
PAH/Phenols (GC/MS - SIM)	EP075(SIM)	WATER	In house: Referenced to USEPA SW 846 - 8270 Sample extracts are analysed by Capillary GC/MS in SIM Mode and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM Schedule B(3)
TRH Volatiles/BTEX	EP080	WATER	In house: Referenced to USEPA SW 846 - 8260 Water samples are directly purged prior to analysis by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. Alternatively, a sample is equilibrated in a headspace vial and a portion of the headspace determined by GCMS analysis. This method is compliant with the QC requirements of NEPM Schedule B(3)

Analytical Methods	Method	Matrix	Method Descriptions
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	WATER	In-house: Analysis of fresh and saline waters by Solid Phase Extraction (SPE) followed by LC-Electrospray-MS-MS, Negative Mode using MRM and internal standard quantitation. Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures and data quality objectives conform to US DoD QSM 5.3, table B-15 requirements.

Preparation Methods	Method	Matrix	Method Descriptions
Hot Block Digest for metals in soils sediments and sludges	EN69	SOIL	In house: Referenced to USEPA 200.2. Hot Block Acid Digestion 1.0g of sample is heated with Nitric and Hydrochloric acids, then cooled. Peroxide is added and samples heated and cooled again before being filtered and bulked to volume for analysis. Digest is appropriate for determination of selected metals in sludge, sediments, and soils. This method is compliant with NEPM Schedule B(3).
Methanolic Extraction of Soils for Purge and Trap	ORG16	SOIL	In house: Referenced to USEPA SW 846 - 5030A. 5g of solid is shaken with surrogate and 10mL methanol prior to analysis by Purge and Trap - GC/MS.
Tumbler Extraction of Solids	ORG17	SOIL	In house: Mechanical agitation (tumbler). 10g of sample, Na2SO4 and surrogate are extracted with 30mL 1:1 DCM/Acetone by end over end tumble. The solvent is decanted, dehydrated and concentrated (by KD) to the desired volume for analysis.
QuECheRS Extraction of Solids	ORG71	SOIL	In house: Sequential extractions with Acetonitrile/Methanol by shaking. Extraction efficiency aided by the addition of salts under acidic conditions. Where relevant, interferences from co-extracted organics are removed with dispersive clean-up media (dSPE). The extract is either diluted or concentrated and exchanged into the analytical solvent.
Digestion for Total Recoverable Metals	EN25	WATER	In house: Referenced to USEPA SW846-3005. Method 3005 is a Nitric/Hydrochloric acid digestion procedure used to prepare surface and ground water samples for analysis by ICPAES or ICPMS. This method is compliant with NEPM Schedule B(3)
Separatory Funnel Extraction of Liquids	ORG14	WATER	In house: Referenced to USEPA SW 846 - 3510 100 mL to 1L of sample is transferred to a separatory funnel and serially extracted three times using DCM for each extract. The resultant extracts are combined, dehydrated and concentrated for analysis. This method is compliant with NEPM Schedule B(3) . ALS default excludes sediment which may be resident in the container.
Volatiles Water Preparation	ORG16-W	WATER	A 5 mL aliquot or 5 mL of a diluted sample is added to a 40 mL VOC vial for purging.
Solid Phase Extraction (SPE) for PFAS in water	ORG72	WATER	In-house: Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures conform to US DoD QSM 5.3, table B-15 requirements.

Edwandy Fadjar	Organic Coordinator	Sydney Organics, Smithfield, NSW
Ivan Taylor	Analyst	Sydney Inorganics, Smithfield, NSW

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EK059G: LOR raised for NOx due to sample matrix.
- EP075 (SIM): Where reported, Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) per the NEPM (2013) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benz(a)anthracene (0.1), Chrysene (0.01), Benzo(b+j) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1.2.3.cd)pyrene (0.1), Dibenz(a.h)anthracene (1.0), Benzo(g.h.i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero.
- EP080: Where reported, Total Xylenes is the sum of the reported concentrations of m&p-Xylene and o-Xylene at or above the LOR.
- EP074: Where reported, Total Trihalomethanes is the sum of the reported concentrations of all Trihalomethanes at or above the LOR.
- EP074: Where reported, Total Trimethylbenzenes is the sum of the reported concentrations of 1.2.3-Trimethylbenzene, 1.2.4-Trimethylbenzene and 1.3.5-Trimethylbenzene at or above the LOR.
- EP075(SIM): Where reported, Total Cresol is the sum of the reported concentrations of 2-Methylphenol and 3- & 4-Methylphenol at or above the LOR.
- EK057G: LOR raised for Nitrite on a few samples due to sample matrix.
- EP080&74: ES2201979-08 has been confrimed by re-analysis.
- TDS by method EA-015 may bias high for various samples due to the presence of fine particulate matter, which may pass through the prescribed GF/C paper.
- Sodium Adsorption Ratio (where reported): Where results for Na, Ca or Mg are <LOR, a concentration at half the reported LOR is incorporated into the SAR calculation. This represents a conservative approach for Na relative to the assumption that <LOR = zero concentration and a conservative approach for Ca & Mg relative to the assumption that <LOR is equivalent to the LOR concentration.

ilac-MRA NATA
Accreditation No. 825
Accredited for compliance with ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Sub-Matrix: **WATER**

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

ALS Environmental

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **ES2201979**	Page	: 1 of 13
Client	: **ENVIRONMENTAL RESOURCES MANAGEMENT (ERM)**	Laboratory	: Environmental Division Sydney
Contact	: NICHOLAS GRBICH	Telephone	: +61-2-8784 8555
Project	: 0628507	Date Samples Received	: 20-Jan-2022
Site	: ----	Issue Date	: 31-Jan-2022
Sampler	: TAJ MONDON	No. of samples received	: 16
Order number	: ----	No. of samples analysed	: 14

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **Laboratory Control outliers exist - please see following pages for full details.**
- **Matrix Spike outliers exist - please see following pages for full details.**
- **Surrogate recovery outliers exist for all regular sample matrices - please see following pages for full details.**

Outliers : Analysis Holding Time Compliance

- **Analysis Holding Time Outliers exist - please see following pages for full details.**

Outliers : Frequency of Quality Control Samples

- **Quality Control Sample Frequency Outliers exist - please see following pages for full details.**

Outliers : Quality Control Samples

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **WATER**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **WATER**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Quality Control Sample Type		Count		Rate (%)			Quality Control Specification
Analytical Methods	*Method*	*QC*	*Regular*	***Actual***	***Expected***	*Evaluation*

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Total Dissolved Solids (High Level)	EA015H	WATER	In house: Referenced to APHA 2540C. A gravimetric procedure that determines the amount of `filterable` residue in an aqueous sample. A well-mixed sample is filtered through a glass fibre filter (1.2um). The filtrate is evaporated to dryness and dried to constant weight at 180+/-5C. This method is compliant with NEPM Schedule B(3)
Alkalinity by PC Titrator	ED037-P	WATER	In house: Referenced to APHA 2320 B This procedure determines alkalinity by automated measurement (e.g. PC Titrate) on a settled supernatant aliquot of the sample using pH 4.5 for indicating the total alkalinity end-point. This method is compliant with NEPM Schedule B(3)
Sulfate (Turbidimetric) as SO4 2- by Discrete Analyser	ED041G	WATER	In house: Referenced to APHA 4500-SO4. Dissolved sulfate is determined in a 0.45um filtered sample. Sulfate ions are converted to a barium sulfate suspension in an acetic acid medium with barium chloride. Light absorbance of the BaSO4 suspension is measured by a photometer and the SO4-2 concentration is determined by comparison of the reading with a standard curve. This method is compliant with NEPM Schedule B(3)
Chloride by Discrete Analyser	ED045G	WATER	In house: Referenced to APHA 4500 Cl - G.The thiocyanate ion is liberated from mercuric thiocyanate through sequestration of mercury by the chloride ion to form non-ionised mercuric chloride.in the presence of ferric ions the librated thiocynate forms highly-coloured ferric thiocynate which is measured at 480 nm APHA seal method 2 017-1-L
Major Cations - Dissolved	ED093F	WATER	In house: Referenced to APHA 3120 and 3125; USEPA SW 846 - 6010 and 6020; Cations are determined by either ICP-AES or ICP-MS techniques. This method is compliant with NEPM Schedule B(3) Sodium Adsorption Ratio is calculated from Ca, Mg and Na which determined by ALS in house method QWI-EN/ED093F. This method is compliant with NEPM Schedule B(3) Hardness parameters are calculated based on APHA 2340 B. This method is compliant with NEPM Schedule B(3)
Dissolved Metals by ICP-MS - Suite A	EG020A-F	WATER	In house: Referenced to APHA 3125; USEPA SW846 - 6020, ALS QWI-EN/EG020. Samples are 0.45µm filtered prior to analysis. The ICPMS technique utilizes a highly efficient argon plasma to ionize selected elements. Ions are then passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to their measurement by a discrete dynode ion detector.
Dissolved Mercury by FIMS	EG035F	WATER	In house: Referenced to APHA 3112 Hg - B (Flow-injection (SnCl2)(Cold Vapour generation) AAS) Samples are 0.45µm filtered prior to analysis. FIM-AAS is an automated flameless atomic absorption technique. A bromate/bromide reagent is used to oxidise any organic mercury compounds in the filtered sample. The ionic mercury is reduced online to atomic mercury vapour by SnCl2 which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM Schedule B(3).
Ammonia as N by Discrete analyser	EK055G	WATER	In house: Referenced to APHA 4500-NH3 G Ammonia is determined by direct colorimetry by Discrete Analyser. This method is compliant with NEPM Schedule B(3)
Nitrite as N by Discrete Analyser	EK057G	WATER	In house: Referenced to APHA 4500-NO2- B. Nitrite is determined by direct colourimetry by Discrete Analyser. This method is compliant with NEPM Schedule B(3)
Nitrate as N by Discrete Analyser	EK058G	WATER	In house: Referenced to APHA 4500-NO3- F. Nitrate is reduced to nitrite by way of a chemical reduction followed by quantification by Discrete Analyser. Nitrite is determined seperately by direct colourimetry and result for Nitrate calculated as the difference between the two results. This method is compliant with NEPM Schedule B(3)

Analytical Methods	Method	Matrix	Method Descriptions
Nitrite and Nitrate as N (NOx) by Discrete Analyser	EK059G	WATER	In house: Referenced to APHA 4500-NO3- F. Combined oxidised Nitrogen (NO2+NO3) is determined by Chemical Reduction and direct colourimetry by Discrete Analyser. This method is compliant with NEPM Schedule B(3)
Total Kjeldahl Nitrogen as N By Discrete Analyser	EK061G	WATER	In house: Referenced to APHA 4500-Norg D (In house). An aliquot of sample is digested using a high temperature Kjeldahl digestion to convert nitrogenous compounds to ammonia. Ammonia is determined colorimetrically by discrete analyser. This method is compliant with NEPM Schedule B(3)
Total Nitrogen as N (TKN + Nox) By Discrete Analyser	EK062G	WATER	In house: Referenced to APHA 4500-Norg / 4500-NO3-. This method is compliant with NEPM Schedule B(3)
Total Phosphorus as P By Discrete Analyser	EK067G	WATER	In house: Referenced to APHA 4500-P H, Jirka et al, Zhang et al. This procedure involves sulphuric acid digestion of a sample aliquot to break phosphorus down to orthophosphate. The orthophosphate reacts with ammonium molybdate and antimony potassium tartrate to form a complex which is then reduced and its concentration measured at 880nm using discrete analyser. This method is compliant with NEPM Schedule B(3)
Ionic Balance by PCT DA and Turbi SO4 DA	* EN055 - PG	WATER	In house: Referenced to APHA 1030F. This method is compliant with NEPM Schedule B(3)
TRH - Semivolatile Fraction	EP071	WATER	In house: Referenced to USEPA SW 846 - 8015 The sample extract is analysed by Capillary GC/FID and quantification is by comparison against an established 5 point calibration curve of n-Alkane standards. This method is compliant with the QC requirements of NEPM Schedule B(3)
Volatile Organic Compounds	EP074	WATER	In house: Referenced to USEPA SW 846 - 8260 Water samples are directly purged prior to analysis by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM Schedule B(3)
PAH/Phenols (GC/MS - SIM)	EP075(SIM)	WATER	In house: Referenced to USEPA SW 846 - 8270 Sample extracts are analysed by Capillary GC/MS in SIM Mode and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM Schedule B(3)
TRH Volatiles/BTEX	EP080	WATER	In house: Referenced to USEPA SW 846 - 8260 Water samples are directly purged prior to analysis by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. Alternatively, a sample is equilibrated in a headspace vial and a portion of the headspace determined by GCMS analysis. This method is compliant with the QC requirements of NEPM Schedule B(3)

Preparation Methods	Method	Matrix	Method Descriptions
TKN/TP Digestion	EK061/EK067	WATER	In house: Referenced to APHA 4500 Norg - D; APHA 4500 P - H. This method is compliant with NEPM Schedule B(3)
Separatory Funnel Extraction of Liquids	ORG14	WATER	In house: Referenced to USEPA SW 846 - 3510 100 mL to 1L of sample is transferred to a separatory funnel and serially extracted three times using DCM for each extract. The resultant extracts are combined, dehydrated and concentrated for analysis. This method is compliant with NEPM Schedule B(3) . ALS default excludes sediment which may be resident in the container.
Volatiles Water Preparation	ORG16-W	WATER	A 5 mL aliquot or 5 mL of a diluted sample is added to a 40 mL VOC vial for purging.

Franco Lentini	LCMS Coordinator	Sydney Organics, Smithfield, NSW
Ivan Taylor	Analyst	Sydney Inorganics, Smithfield, NSW

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP075 (SIM): Where reported, Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) per the NEPM (2013) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benz(a)anthracene (0.1), Chrysene (0.01), Benzo(b+j) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1.2.3.cd)pyrene (0.1), Dibenz(a.h)anthracene (1.0), Benzo(g.h.i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero.
- EP075: Where reported, Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) per the NEPM (2013) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benz(a)anthracene (0.1), Chrysene (0.01), Benzo(b+j) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1.2.3.cd)pyrene (0.1), Dibenz(a.h)anthracene (1.0), Benzo(g.h.i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero.
- EP231X - Per- and Polyfluoroalkyl Substances (PFAS): Samples received in 20ml or 125ml bottles have been tested in accordance with the QSM5.3 compliant, NATA accredited method. 60mL or 250mL bottles have been tested to the legacy QSM 5.1 aligned, NATA accredited method.
- EP080: Where reported, Total Xylenes is the sum of the reported concentrations of m&p-Xylene and o-Xylene at or above the LOR.
- EP074: Where reported, Total Trihalomethanes is the sum of the reported concentrations of all Trihalomethanes at or above the LOR.
- EP074: Where reported, Total Trimethylbenzenes is the sum of the reported concentrations of 1.2.3-Trimethylbenzene, 1.2.4-Trimethylbenzene and 1.3.5-Trimethylbenzene at or above the LOR.
- EP075(SIM): Where reported, Total Cresol is the sum of the reported concentrations of 2-Methylphenol and 3- & 4-Methylphenol at or above the LOR.
- EP231X: Positive result for various analytes on sample ES2202047_001,004-005,007,009-011,017,019,021 has been confirmed by re-extraction and re-analysis.
- EG035: Poor matrix spike recovery was obtained for Mercury on sample ES2201942 # 1. Confirmed by re-analysis.
- EK059G, EK057G: NOx and Nitrite results for sample no: 12 confirmed via re-analysis.
- EP075: Poor surrogate recovery due to sample heterogeneity. Confirmed by re-extraction and re-analysis.
- EP075(SIM): Particular sample phenolic surrogate not determined due to sample matrix interferences.
- EP080: Sample TRIP SPIKE contains volatile compounds spiked into the sample containers prior to dispatch from the laboratory. BTEXN compounds spiked at 20 ug/L.
- EP075: Where reported, 'Sum of PAH' is the sum of the USEPA 16 priority PAHs
- Sodium Adsorption Ratio (where reported): Where results for Na, Ca or Mg are <LOR, a concentration at half the reported LOR is incorporated into the SAR calculation. This represents a conservative approach for Na relative to the assumption that <LOR = zero concentration and a conservative approach for Ca & Mg relative to the assumption that <LOR is equivalent to the LOR concentration.
- EP231: Stable isotope enriched internal standards are added to samples prior to extraction. Target compounds have a direct analogous internal standard with the exception of PFPeS, PFHpA, PFDS, PFTrDA and 10:2 FTS. These compounds use an internal standard that is chemically related and has a retention time close to that of the target compound. The DQO for internal standard response is 50-150% of that established at initial calibration. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These practices are in line with recommendations in the National Environmental Management Plan for PFAS (Australian HEPA) and also conform to QSM 5.3 (US DoD) requirements.

QUALITY CONTROL REPORT

Work Order	: **ES2202047**	Page	: 1 of 22
Client	: **ENVIRONMENTAL RESOURCES MANAGEMENT (ERM)**	Laboratory	: Environmental Division Sydney
Contact	: NICHOLAS GRBICH	Contact	: Customer Services ES
Address	: LEVEL 15 309 KENT STREET SYDNEY NSW AUSTRALIA 2000	Address	: 277-289 Woodpark Road Smithfield NSW Australia 2164
Telephone	: ----	Telephone	: +61-2-8784 8555
Project	: 0628507	Date Samples Received	: 21-Jan-2022
Order number	: ----	Date Analysis Commenced	: 24-Jan-2022
C-O-C number	: ----	Issue Date	: 01-Feb-2022
Sampler	: TAJ MONDON		
Site	: ----		
Quote number	: EN/114		
No. of samples received	: 24		
No. of samples analysed	: 23		

Accreditation No. 825
Accredited for compliance with ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Ankit Joshi	Inorganic Chemist	Sydney Inorganics, Smithfield, NSW
Edwandy Fadjar	Organic Coordinator	Sydney Organics, Smithfield, NSW
Franco Lentini	LCMS Coordinator	Sydney Organics, Smithfield, NSW
Ivan Taylor	Analyst	Sydney Inorganics, Smithfield, NSW

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Sub-Matrix: **WATER**

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Sub-Matrix: **WATER**

				Method Blank (MB) Report	Laboratory Control Spike (LCS) Report			
					Spike	Spike Recovery (%)	Acceptable Limits (%)	
Method: Compound	CAS Number	LOR	Unit	Result	Concentration	LCS	Low	High

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **Laboratory Control outliers exist - please see following pages for full details.**
- **Matrix Spike outliers exist - please see following pages for full details.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **Analysis Holding Time Outliers exist - please see following pages for full details.**

Outliers : Frequency of Quality Control Samples

- **Quality Control Sample Frequency Outliers exist - please see following pages for full details.**

Outliers : Quality Control Samples

Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Matrix: **WATER**

Compound Group Name	Laboratory Sample ID	Client Sample ID	Analyte	CAS Number	Data	Limits	Comment
Laboratory Control Spike (LCS) Recoveries							
EK067G: Total Phosphorus as P by Discrete Analyser	QC-MRG2-41369580	----	**Total Phosphorus as P**	----	109 %	72.0-108%	**Recovery greater than upper control limit**
EP075B: Polynuclear Aromatic Hydrocarbons	QC-4136770-002	----	**2-Chloronaphthalene**	91-58-7	59.4 %	60.6-106%	**Recovery less than lower control limit**
EP075E: Nitroaromatics and Ketones	QC-4136770-002	----	**1-Naphthylamine**	134-32-7	116 %	46.8-102%	**Recovery greater than upper control limit**
EP075E: Nitroaromatics and Ketones	QC-4136770-002	----	**Phenacetin**	62-44-2	103 %	57.8-101%	**Recovery greater than upper control limit**
EP075F: Haloethers	QC-4136770-002	----	**Bis(2-chloroethyl) ether**	111-44-4	59.9 %	69.1-112%	**Recovery less than lower control limit**
Matrix Spike (MS) Recoveries							
ED041G: Sulfate (Turbidimetric) as SO4 2- by DA	ES2202021--001	Anonymous	**Sulfate as SO4 - Turbidimetric**	14808-79-8	Not Determined	----	**MS recovery not determined, background level greater than or equal to 4x spike level.**
ED045G: Chloride by Discrete Analyser	ES2202047--012	BUR_BH125	**Chloride**	16887-00-6	Not Determined	----	**MS recovery not determined, background level greater than or equal to 4x spike level.**
EG035F: Dissolved Mercury by FIMS	ES2201942--001	Anonymous	**Mercury**	7439-97-6	40.6 %	70.0-130%	**Recovery less than lower data quality objective**
EK055G: Ammonia as N by Discrete Analyser	ES2201979--001	Anonymous	**Ammonia as N**	7664-41-7	Not Determined	----	**MS recovery not determined, background level greater than or equal to 4x spike level.**

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **WATER**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **WATER**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Total Dissolved Solids (High Level)	EA015H	WATER	In house: Referenced to APHA 2540C. A gravimetric procedure that determines the amount of `filterable` residue in an aqueous sample. A well-mixed sample is filtered through a glass fibre filter (1.2um). The filtrate is evaporated to dryness and dried to constant weight at 180+/-5C. This method is compliant with NEPM Schedule B(3)
Alkalinity by PC Titrator	ED037-P	WATER	In house: Referenced to APHA 2320 B This procedure determines alkalinity by automated measurement (e.g. PC Titrate) on a settled supernatant aliquot of the sample using pH 4.5 for indicating the total alkalinity end-point. This method is compliant with NEPM Schedule B(3)
Sulfate (Turbidimetric) as SO4 2- by Discrete Analyser	ED041G	WATER	In house: Referenced to APHA 4500-SO4. Dissolved sulfate is determined in a 0.45um filtered sample. Sulfate ions are converted to a barium sulfate suspension in an acetic acid medium with barium chloride. Light absorbance of the BaSO4 suspension is measured by a photometer and the SO4-2 concentration is determined by comparison of the reading with a standard curve. This method is compliant with NEPM Schedule B(3)
Chloride by Discrete Analyser	ED045G	WATER	In house: Referenced to APHA 4500 Cl - G.The thiocyanate ion is liberated from mercuric thiocyanate through sequestration of mercury by the chloride ion to form non-ionised mercuric chloride.in the presence of ferric ions the librated thiocynate forms highly-coloured ferric thiocynate which is measured at 480 nm APHA seal method 2 017-1-L
Major Cations - Dissolved	ED093F	WATER	In house: Referenced to APHA 3120 and 3125; USEPA SW 846 - 6010 and 6020; Cations are determined by either ICP-AES or ICP-MS techniques. This method is compliant with NEPM Schedule B(3) Sodium Adsorption Ratio is calculated from Ca, Mg and Na which determined by ALS in house method QWI-EN/ED093F. This method is compliant with NEPM Schedule B(3) Hardness parameters are calculated based on APHA 2340 B. This method is compliant with NEPM Schedule B(3)
Dissolved Metals by ICP-MS - Suite A	EG020A-F	WATER	In house: Referenced to APHA 3125; USEPA SW846 - 6020, ALS QWI-EN/EG020. Samples are 0.45µm filtered prior to analysis. The ICPMS technique utilizes a highly efficient argon plasma to ionize selected elements. Ions are then passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to their measurement by a discrete dynode ion detector.
Total Metals by ICP-MS - Suite A	EG020A-T	WATER	In house: Referenced to APHA 3125; USEPA SW846 - 6020, ALS QWI-EN/EG020. The ICPMS technique utilizes a highly efficient argon plasma to ionize selected elements. Ions are then passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to their measurement by a discrete dynode ion detector.
Dissolved Mercury by FIMS	EG035F	WATER	In house: Referenced to APHA 3112 Hg - B (Flow-injection (SnCl2)(Cold Vapour generation) AAS) Samples are 0.45µm filtered prior to analysis. FIM-AAS is an automated flameless atomic absorption technique. A bromate/bromide reagent is used to oxidise any organic mercury compounds in the filtered sample. The ionic mercury is reduced online to atomic mercury vapour by SnCl2 which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM Schedule B(3).

Analytical Methods	Method	Matrix	Method Descriptions
Total Mercury by FIMS	EG035T	WATER	In house: Referenced to APHA 3112 Hg - B (Flow-injection (SnCl2)(Cold Vapour generation) AAS) FIM-AAS is an automated flameless atomic absorption technique. A bromate/bromide reagent is used to oxidise any organic mercury compounds in the unfiltered sample. The ionic mercury is reduced online to atomic mercury vapour by SnCl2 which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM Schedule B(3).
Ammonia as N by Discrete analyser	EK055G	WATER	In house: Referenced to APHA 4500-NH3 G Ammonia is determined by direct colorimetry by Discrete Analyser. This method is compliant with NEPM Schedule B(3)
Nitrite as N by Discrete Analyser	EK057G	WATER	In house: Referenced to APHA 4500-NO2- B. Nitrite is determined by direct colourimetry by Discrete Analyser. This method is compliant with NEPM Schedule B(3)
Nitrate as N by Discrete Analyser	EK058G	WATER	In house: Referenced to APHA 4500-NO3- F. Nitrate is reduced to nitrite by way of a chemical reduction followed by quantification by Discrete Analyser. Nitrite is determined seperately by direct colourimetry and result for Nitrate calculated as the difference between the two results. This method is compliant with NEPM Schedule B(3)
Nitrite and Nitrate as N (NOx) by Discrete Analyser	EK059G	WATER	In house: Referenced to APHA 4500-NO3- F. Combined oxidised Nitrogen (NO2+NO3) is determined by Chemical Reduction and direct colourimetry by Discrete Analyser. This method is compliant with NEPM Schedule B(3)
Total Kjeldahl Nitrogen as N By Discrete Analyser	EK061G	WATER	In house: Referenced to APHA 4500-Norg D (In house). An aliquot of sample is digested using a high temperature Kjeldahl digestion to convert nitrogenous compounds to ammonia. Ammonia is determined colorimetrically by discrete analyser. This method is compliant with NEPM Schedule B(3)
Total Nitrogen as N (TKN + Nox) By Discrete Analyser	EK062G	WATER	In house: Referenced to APHA 4500-Norg / 4500-NO3-. This method is compliant with NEPM Schedule B(3)
Total Phosphorus as P By Discrete Analyser	EK067G	WATER	In house: Referenced to APHA 4500-P H, Jirka et al, Zhang et al. This procedure involves sulphuric acid digestion of a sample aliquot to break phosphorus down to orthophosphate. The orthophosphate reacts with ammonium molybdate and antimony potassium tartrate to form a complex which is then reduced and its concentration measured at 880nm using discrete analyser. This method is compliant with NEPM Schedule B(3)
Reactive Phosphorus as P-By Discrete Analyser	EK071G	WATER	In house: Referenced to APHA 4500-P F Ammonium molybdate and potassium antimonyl tartrate reacts in acid medium with othophosphate to form a heteropoly acid -phosphomolybdic acid - which is reduced to intensely coloured molybdenum blue by ascorbic acid. Quantification is by Discrete Analyser. This method is compliant with NEPM Schedule B(3)
Ionic Balance by PCT DA and Turbi SO4 DA	* EN055 - PG	WATER	In house: Referenced to APHA 1030F. This method is compliant with NEPM Schedule B(3)
TRH - Semivolatile Fraction	EP071	WATER	In house: Referenced to USEPA SW 846 - 8015 The sample extract is analysed by Capillary GC/FID and quantification is by comparison against an established 5 point calibration curve of n-Alkane standards. This method is compliant with the QC requirements of NEPM Schedule B(3)
Volatile Organic Compounds	EP074	WATER	In house: Referenced to USEPA SW 846 - 8260 Water samples are directly purged prior to analysis by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM Schedule B(3)
Semivolatile Organic Compounds	EP075	WATER	In house: Referenced to USEPA SW 846 - 8270 Sample extracts are analysed by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM Schedule B(3)

Analytical Methods	Method	Matrix	Method Descriptions
PAH/Phenols (GC/MS - SIM)	EP075(SIM)	WATER	In house: Referenced to USEPA SW 846 - 8270 Sample extracts are analysed by Capillary GC/MS in SIM Mode and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM Schedule B(3)
TRH Volatiles/BTEX	EP080	WATER	In house: Referenced to USEPA SW 846 - 8260 Water samples are directly purged prior to analysis by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. Alternatively, a sample is equilibrated in a headspace vial and a portion of the headspace determined by GCMS analysis. This method is compliant with the QC requirements of NEPM Schedule B(3)
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	WATER	In-house: Analysis of fresh and saline waters by Solid Phase Extraction (SPE) followed by LC-Electrospray-MS-MS, Negative Mode using MRM and internal standard quantitation. Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures and data quality objectives conform to US DoD QSM 5.3, table B-15 requirements.

Preparation Methods	Method	Matrix	Method Descriptions
TKN/TP Digestion	EK061/EK067	WATER	In house: Referenced to APHA 4500 Norg - D; APHA 4500 P - H. This method is compliant with NEPM Schedule B(3)
Digestion for Total Recoverable Metals	EN25	WATER	In house: Referenced to USEPA SW846-3005. Method 3005 is a Nitric/Hydrochloric acid digestion procedure used to prepare surface and ground water samples for analysis by ICPAES or ICPMS. This method is compliant with NEPM Schedule B(3)
Separatory Funnel Extraction of Liquids	ORG14	WATER	In house: Referenced to USEPA SW 846 - 3510 100 mL to 1L of sample is transferred to a separatory funnel and serially extracted three times using DCM for each extract. The resultant extracts are combined, dehydrated and concentrated for analysis. This method is compliant with NEPM Schedule B(3) . ALS default excludes sediment which may be resident in the container.
Volatiles Water Preparation	ORG16-W	WATER	A 5 mL aliquot or 5 mL of a diluted sample is added to a 40 mL VOC vial for purging.
Solid Phase Extraction (SPE) for PFAS in water	ORG72	WATER	In-house: Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures conform to US DoD QSM 5.3, table B-15 requirements.

ilac-MRA NATA
Accreditation No. 825
Accredited for compliance with ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Descriptive Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Alana Smylie	Asbestos Identifier	Newcastle - Asbestos, Mayfield West, NSW
Edwandy Fadjar	Organic Coordinator	Sydney Organics, Smithfield, NSW
Franco Lentini	LCMS Coordinator	Sydney Inorganics, Smithfield, NSW
Franco Lentini	LCMS Coordinator	Sydney Organics, Smithfield, NSW
Ivan Taylor	Analyst	Sydney Inorganics, Smithfield, NSW

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP075 (SIM): Where reported, Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) per the NEPM (2013) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benz(a)anthracene (0.1), Chrysene (0.01), Benzo(b+j) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1.2.3.cd)pyrene (0.1), Dibenz(a.h)anthracene (1.0), Benzo(g.h.i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero.
- Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) per the NEPM (2013) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benz(a)anthracene (0.1), Chrysene (0.01), Benzo(b+j) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1.2.3.cd)pyrene (0.1), Dibenz(a.h)anthracene (1.0), Benzo(g.h.i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero, for 'TEQ 1/2LOR' are treated as half the reported LOR, and for 'TEQ LOR' are treated as being equal to the reported LOR. Note: TEQ 1/2LOR and TEQ LOR will calculate as 0.6mg/Kg and 1.2mg/Kg respectively for samples with non-detects for all of the eight TEQ PAHs.
- EP080: Where reported, Total Xylenes is the sum of the reported concentrations of m&p-Xylene and o-Xylene at or above the LOR.
- EP068: Where reported, Total Chlordane (sum) is the sum of the reported concentrations of cis-Chlordane and trans-Chlordane at or above the LOR.
- EP068: Where reported, Total OCP is the sum of the reported concentrations of all Organochlorine Pesticides at or above LOR.
- EP074: Where reported, Total Trihalomethanes is the sum of the reported concentrations of all Trihalomethanes at or above the LOR.
- EP074: Where reported, Total Xylenes is the sum of the reported concentrations of m&p-Xylene and o-Xylene at or above the LOR.
- EP074: Where reported, Sum of chlorinated hydrocarbons includes carbon tetrachloride, chlorobenzene, chloroform, 1,2-dichlorobenzene, 1,4-dichlorobenzene, 1,2-dichloroethane, 1,1-dichloroethene, cis-1,2-dichlorothene, trans-1,2-dichlorothene, 1,1,1,2-tetrachloroethane, 1,1,2,2-tetrachloroethane, 1,2,4-trichlorobenzene, 1,1,1-trichloroethane, 1,1,2-trichloroethane, trichloroethene, vinyl chloride, hexachlorobutadiene and methylene chloride.
- EP074: Where reported, Total Trimethylbenzenes is the sum of the reported concentrations of 1.2.3-Trimethylbenzene, 1.2.4-Trimethylbenzene and 1.3.5-Trimethylbenzene at or above the LOR.
- EP075(SIM): Where reported, Total Cresol is the sum of the reported concentrations of 2-Methylphenol and 3- & 4-Methylphenol at or above the LOR.
- EP080: Positive results for sample ES2202264-033 was confirmed by re-analysis.
- EP080: The trip spike and its control have been analysed for volatile TPH and BTEXN only. The trip spike and control were prepared in the lab using reagent grade sand spiked with petrol. The spike was dispatched from the lab and the control retained.
- EP075: Where reported, 'Sum of PAH' is the sum of the USEPA 16 priority PAHs
- EA200 'Am' Amosite (brown asbestos)
- EA200 'Cr' Crocidolite (blue asbestos)
- EA200 'Trace' - Asbestos fibres ("Free Fibres") detected by trace analysis per AS4964. The result can be interpreted that the sample contains detectable 'respirable' asbestos fibres
- EA200: Asbestos Identification Samples were analysed by Polarised Light Microscopy including dispersion staining.
- EA200 Legend
- EA200 'Ch' Chrysotile (white asbestos)

- EA200: 'UMF' Unknown Mineral Fibres. "-" indicates fibres detected may or may not be asbestos fibres. Confirmation by alternative techniques is recommended.
- Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benz(a)anthracene (0.1), Chrysene (0.01), Benzo(b+j) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1.2.3.cd)pyrene (0.1), Dibenz(a.h)anthracene (1.0), Benzo(g.h.i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero, for 'TEQ 1/2LOR' are treated as half the reported LOR, and for 'TEQ LOR' are treated as being equal to the reported LOR. Note: TEQ 1/2LOR and TEQ LOR will calculate as 0.6mg/Kg and 1.2mg/Kg respectively for samples with non-detects for all of the eight TEQ PAHs.
- EA200: For samples larger than 30g, the <2mm fraction may be sub-sampled prior to trace analysis as outlined in ISO23909:2008(E) Sect 6.3.2-2
- EA200: 'Yes' - Asbestos detected by polarised light microscopy including dispersion staining.
- EA200: 'No*' - No asbestos found, at the reporting limit of 0.1g/kg, by polarised light microscopy including dispersion staining. Asbestos material was detected and positively identified at concentrations estimated to be below 0.1g/kg.
- EA200: 'No' - No asbestos found at the reporting limit 0.1g/kg, by polarised light microscopy including dispersion staining.
- EP231: Stable isotope enriched internal standards are added to samples prior to extraction. Target compounds have a direct analogous internal standard with the exception of PFPeS, PFHpA, PFDS, PFTrDA and 10:2 FTS. These compounds use an internal standard that is chemically related and has a retention time close to that of the target compound. The DQO for internal standard response is 50-150% of that established at initial calibration. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These practices are in line with recommendations in the National Environmental Management Plan for PFAS (Australian HEPA) and also conform to QSM 5.3 (US DoD) requirements.

No. of samples received	: 57		
No. of samples analysed	: 56		

ilac-MRA NATA
Accreditation No. 825
Accredited for compliance with ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Alana Smylie	Asbestos Identifier	Newcastle - Asbestos, Mayfield West, NSW
Edwandy Fadjar	Organic Coordinator	Sydney Organics, Smithfield, NSW
Franco Lentini	LCMS Coordinator	Sydney Inorganics, Smithfield, NSW
Franco Lentini	LCMS Coordinator	Sydney Organics, Smithfield, NSW
Ivan Taylor	Analyst	Sydney Inorganics, Smithfield, NSW

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Sub-Matrix: **SOIL**

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.
